Structure of Pine Stands in the Southeast

William A. Bechtold, Resource Analyst
Forest Inventory and Analysis
Asheville, North Carolina

Gregory A. Ruark, Research Soil Scientist
Forest Soil Productivity in the Southeast
Research Triangle Park, North Carolina

ABSTRACT

Distributional and statistical information associated with variables commonly used to describe stand structure are reported for the major pine cover types of the Southeast. Variables presented include stand age, site index, basal area per acre, number of stems per acre, and stand density index. Means, standard deviations, and ranges of these variables are listed by State and physiographic region for loblolly, slash, longleaf, pond, shortleaf, and Virginia pine cover types. Illustrations of multidimensional relationships among some of the variables are also provided. This information is intended as a general guide to the ranges of conditions found in southeastern pine stands, and can be used by forest growth modelers to design sampling strategies and determine populations of inference.

Keywords : Southern pine, timberland, Pinus, stand structure, forest inventory.

Introduction

The five Southeastern States produced 3.6 billion cubic feet of industrial timber products and **fuelwood** in 1984 (U.S. Department of Agriculture 1988). About 2.5 billion cubic feet of this volume, worth nearly \$1.3 billion on the stump, came from softwood species--primarily southern yellow pines. In addition to providing much of the raw material for a huge and growing forest products industry, these species are tremendously important to the ecology of the region. About 40 percent of the 85 million acres of timberland in the Southeast are dominated by yellow pines.

Important decisions governing the management of this resource are frequently based on growth models that utilize such stand structural variables as age, density, and site quality. To simplify the relationships between these structural variables and growth, many models are derived from stands that represent idealized conditions. With minimal attention given to prevailing forest conditions during the sample selection process, the applicability of these models to the general population of stands throughout the region is unclear. Some users, therefore, may be extrapolating beyond the range of the data used to construct the models, even for conditions common throughout the region.

Recent changes in the growth rates of southern yellow pines in the Southeast (Sheffield and others 1985) underscore the need to develop simulation models to evaluate the regional impacts of biotic and **abiotic** stresses on stand dynamics. These models will likely include some of the same structural variables used in **growth** and yield models. For meaningful regional biological and economic assessments, it is necessary to demonstrate that results from simulations are relevant to the population of forests within the region.

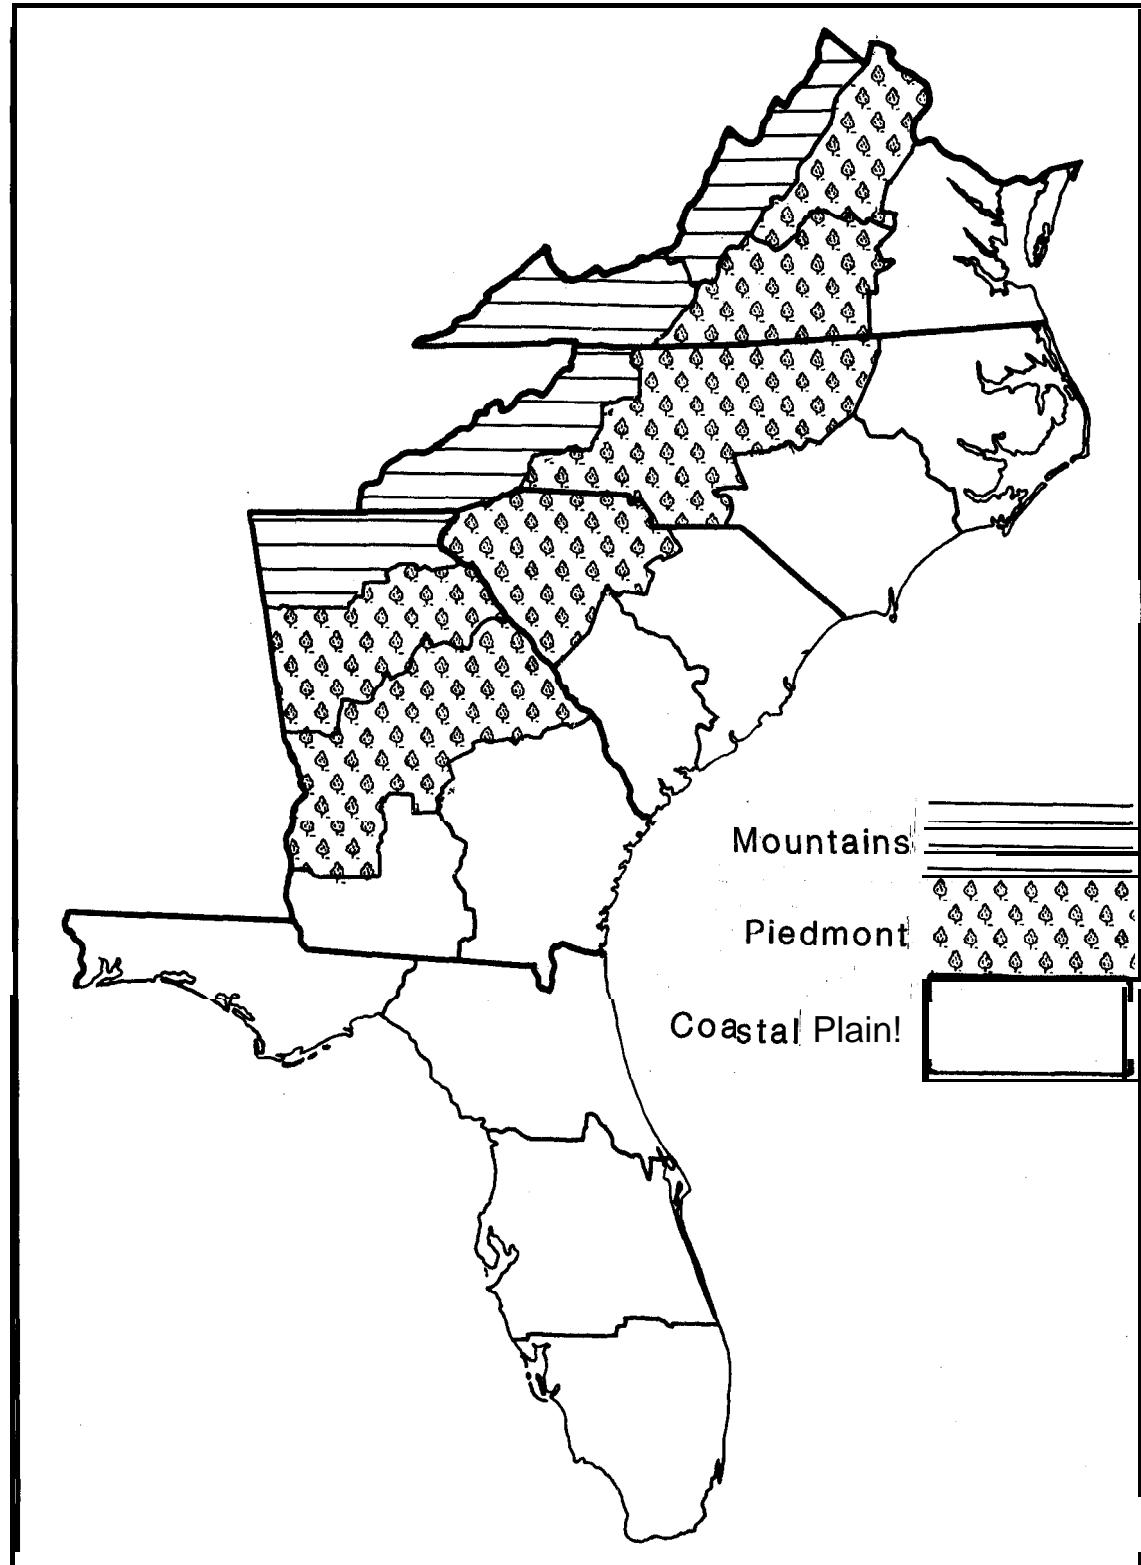

Figure 1.—FIA Survey Units in the Southeast, by State and physiographic region.

Whatever the purpose of a model, maximum utility can be gained by designing sampling strategies that best represent the population of inference. Basic information about the distributions of stand structural characteristics is fundamental to this process. Forest Inventory and Analysis (**FIA**) is the best source of detailed forest resource data available for regional populations of trees and timber stands. Although FIA acreage and volume data are routinely summarized and reported at State, Survey Unit, and County levels, distributional information about mensurationally based stand level variables has never been published. Our purpose here is to provide this information for variables commonly used to describe the structure and growth of pine stands in the Southeast. This Paper is intended as a general guide to the ranges of conditions found in the major pine cover types of the region.

Sampling Methods

In the Southeast, FIA maintains approximately 27,000 permanent forest plots systematically distributed to attain a proportionate sample of all major forest types, sites, and ownerships. The 5-State

region is divided into 21 Survey Units (fig. 1). Each State consists of three to five Survey Units. The boundaries of these Units are compatible with the three major physiographic areas of the Southeast (Mountains, Piedmont, and Coastal Plain). Sampling intensity within each Survey Unit is designed to achieve a minimum accuracy of ± 5 percent per billion cubic feet of **growing-stock** inventory volume at one standard error. Across the region, each sample represents an average of 3,100 acres of timberland. Data presented in this document were collected over a 7-year period, ranging from the 1980 inventory of Georgia to the 1987 inventory of Florida (table 1).

Stand characteristics at each plot location were estimated from measurements taken from a cluster of five variable-radius points spaced 70 feet apart. The limiting distance of sample trees 5.0 inches d.b.h. and larger was dependent on a basal area factor of 37.5. Trees between 1.0 and 4.9 inches d.b.h. were tallied from five 1/300-acre fixed-radius plots that shared common point centers with the cluster of variable plots.

Table 1. --Dates of FIA inventories by State, and numbers of Survey Units by physiographic region, in the Southeast

State	Dates of inventory	Physiographic region	Number of Survey Units
Florida	9/86-10/87	Coastal Plain	4
Georgia	5/80-1/83	Coastal Plain	2
		Piedmont	2
		Mountains	1
North Carolina	11/82-9/84	Coastal Plain	2
		Piedmont	1
		Mountains	1
South Carolina	11/85-9/86	Coastal Plain	2
		Piedmont	1
Virginia	9/84-11/85	Coastal Plain	1
		Piedmont	2
		Mountains	2

Structural Variables

Five descriptors of stand structure were chosen for display: stand age, site index, basal area per acre; numbers of stems per acre, and stand density index. Stand age is defined as the average chronological age of all trees identified as part of a manageable stand. In most cases, especially in pine stands, the manageable stand is synonymous with the primary overstory. Sample trees for estimating site quality were selected from the dominant and codominant trees within each stand. Height and age data from the site trees were used to assign a site index based on the curves developed by Schumacher and Coile (1960). Numbers of trees and basal area per acre were computed by methods adapted from Beers and Miller (1964). Stand density index was calculated as proposed by Reineke (1933). All computations involving numbers of stems, basal area, and density index include trees 1.0 inch d.b.h. and larger. Numbers of trees and basal area statistics are presented for pine species separately, and then again for all species encountered in the sampled stands. The ratio of pine:total species is a useful indicator of hardwood competition.

Organization

Forest cover types were stratified into five broad classes: planted pine, natural pine, oak-pine, upland hardwood, and lowland hardwood stands. Stands with more than 50 percent of the total stocking in pine trees were classified as either "planted" or "natural" pine stands. Stands where pines contributed 25 to 50 percent of the stocking were categorized as "oak-pine." Stands with less than 25 percent of the total stocking in pine were classed as "hardwood." Hardwoods were subdivided into upland or lowland types on the basis of species composition and hydrologic conditions.

Breakdowns of timberland area in the Southeast by broad forest type, physiographic region, and State are shown in figures 2 and 3. The remainder of the Paper is devoted solely to the planted and natural pine segment of the resource.

Explicit information related to stand structure is provided for the following detailed pine cover types:

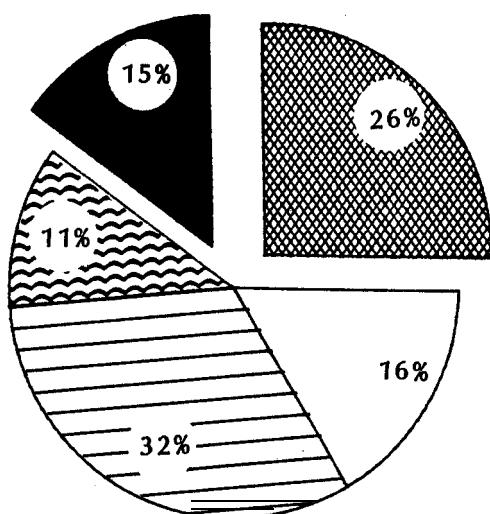

1. Loblolly pine (Pinus taeda L.), natural
2. Loblolly pine, planted
3. Slash pine (P. elliottii Engelm.), natural
4. Slash pine, planted
5. Longleaf pine (P. palustris Mill.),
6. Pond pine (P. serotina Michx.),
7. Shortleaf pine (P. echinata Mill.),
8. Virginia pine (P. virginiana Mill.), and
9. Other.

These cover types are based on the species that make up a plurality of the pine stocking in each stand. The category listed as "'other" encompasses eastern white pine-eastern hemlock (P. strobus L. and Tsuga canadensis (L.) Carr.), red spruce-balsam fir (Picea rubens Sarg. and Abies balsamea (L.) Mill.), sand pine (Pinus clausa (Chapm. ex Engelm.) Vasey ex Sarg.), eastern redcedar (Juniperus virginiana L.), spruce pine (P. glabra Walt.), pitch pine (Pinus rigida Mill.), and Table Mountain pine (P. pungens Lamb.) forest types. Of these, the only types of ahv consequence are white pine-hemlock in the northern and mountain areas of the region, and sand pine in Florida. Cypress types are grouped with lowland hardwood stands and are not included in any detailed tables.

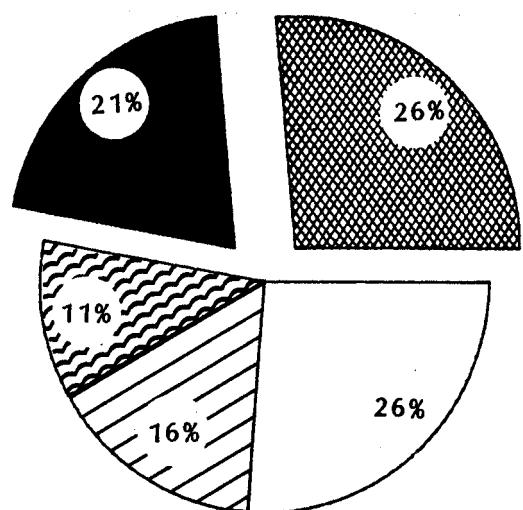

Distributions of each structural variable, by pine forest type, are presented in tabular format for 20 combinations of geographic areas:

1. The entire Southeast (table 2),
2. The three physiographic regions of the Southeast (tables 3-5),
3. The five Southeastern States (tables 6-10), and
4. Each State by physiographic region (tables 11-21).

Figure 3.--Percentage distribution of all timberland in the southeast, by broad forest type and State,

Another four tables provide stand structural information by ownership. Detailed pine forest types have been aggregated into two categories (planted and natural) in these tables. Ownership data are provided for:

1. The entire Southeast (table 22), and
2. The three physiographic regions of the Southeast (tables 23-25).

(Tables 2-25 are listed separately at the back.)

In addition to tabular information, breakdowns of acreage by forest type and physiographic region, State, stand age, site index, and basal area per acre are shown graphically in figures 5-9. All remaining illustrations (figs. 10A-64C) show multidimensional relationships among selected structural variables. In most cases, three block charts are provided for each pine cover type:

1. Site index by stand age (frequency distribution where each cell represents a percentage of total acreage),
2. Basal area per acre by stand age (frequency distribution where each cell represents a percentage of total acreage),
3. Site index by stand age (each cell equals the average percentage of total basal area per acre in that cell consisting of species other than yellow pine).

These block charts are presented by pine cover type for:

1. The entire Southeast (figs. 10A-17C),
2. The three physiographic regions of the Southeast (figs. 18A-33C), and
3. The five Southeastern States (figs. 34A-64C).

(Figures 5-64 are listed separately at the back.)

Special Notes

No graphs are provided for the "other" pine forest types. Since this category includes a mixture of minor types, relationships among structural variables are not biologically meaningful. Also, when

stratified by State and physiographic region, some of the major pine cover types were poorly represented. For example, few Virginia pine stands are located in Florida. Graphic information is omitted for situations where major types are represented by less than 100,000 acres.

Site index data for Georgia will not be available until the sixth inventory of the State is completed in 1989. For this reason, there are no graphs involving site index for Georgia; only the basal area per acre by stand age relationships are shown (figs. 40-47). Where data from Georgia were aggregated with other States across physiographic regions, the Georgia data were treated as missing values and withheld from calculations of average site indices. Also, when aggregating across physiographic regions, most or all of some major types were located exclusively in Georgia, and the corresponding graphs involving site index were unobtainable. This was the situation for planted slash pine stands in the Piedmont (fig. 28) and for natural loblolly and shortleaf pine stands in the Mountains (figs. 31 and 32).

Numbers of pine stems and pine basal area per acre in tables 2-25 refer to yellow pine species only. Numbers and basal area of pines in some "other" pine forest types may therefore be misleading, because some of the types included under this category are not yellow pine forest types. For example, the majority of "other" pine stands in Virginia are white pine-hemlock stands. The only yellow pines these stands might contain are a few scattered Virginia pines. White pine is not included with the pine stems and pine basal area figures shown for these stands.

No separate table is presented for the Coastal Plain of Florida because the entire State is in the Coastal Plain. Such a table would be a duplication of table 6.

Finally, the numbers in the graphs and tables may differ slightly from the given totals or previously published numbers due to rounding.

Example of Use

Suppose a model is to be used to simulate the impact of an environmental stress on the growth of loblolly pine, and that an assessment of the regional impact of this stress is desired. Some of the best data currently available for loblolly are based on research conducted in plantation ecosystems, where uniform spacing and control of competing vegetation simplify the understanding of stand dynamics. As a result, initial attempts to construct a stand-level growth model might logically draw on plantation data. Application of such a model to regional populations of loblolly stands requires a knowledge of

1. the proportion of the total landscape represented by the model,
2. the portion of the landscape not represented by the model, and
3. the assumptions or additional data that would allow greater extrapolation of simulation results.

A model built from loblolly plantation data will be most valid for analyzing the growth of plantations with ages, den-

sities, and site conditions similar to those used to fit the model. The use of such a model for loblolly plantations with stand structures outside the range of sampled data requires assumptions of similar behavior outside the observed range. Furthermore, recalibration of a plantation model for application to natural stands may be especially risky if the distributions of stand structural variables are dissimilar. Major differences indicate that entirely different model specifications may be warranted. In like manner, stand structural relationships can be used to determine the portability of models between species. Identification of how the distributions of key mensurational stand factors overlap for different cover types is a necessary step in such evaluations.

In figure 4, loblolly and shortleaf basal area data from table 2 are summarized in the form of boxplots (Velleman and Hoaglin 1981). Each box in figure 4 is bounded by the 25th and 75th percentiles, so half of the data from each cover type are concentrated in the boxes. The lines on either side of each box represent the minimum and maxi-

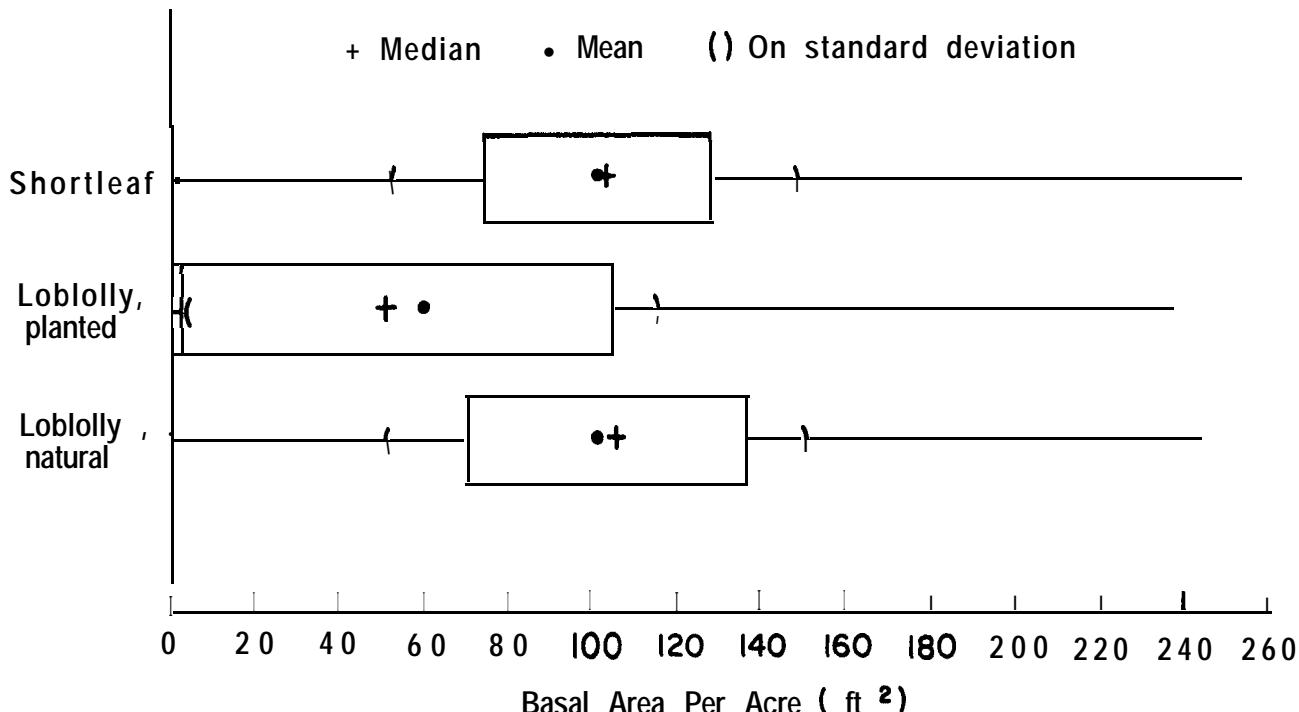

Figure 4.-Box plots of shortleaf and loblolly pine stands in the Southeast.

mum observed values. Medians, means, and standard deviations are also shown.

From these plots it is obvious that, with respect to total basal area, the distributions of planted and natural loblolly stands differ considerably. Basal areas of natural loblolly stands appear to be normally distributed, while those of planted stands are severely skewed, with the mean differing from the median by more than 18 percent. Values to the left of the 25th percentile indicate that one-fourth of all planted loblolly stands in the Southeast contain 3 square feet of basal area, or less. The mean basal area of natural loblolly stands is nearly double that of planted stands. These differences are largely attributable to a mean age of 12 years in planted stands versus 32 years in natural stands (table 2). Also, the proportion of hardwoods in natural stands is more than twice the hardwood ratio of planted stands. Hardwoods make up 27 percent of the basal area in natural loblolly stands, compared with 13 percent in loblolly plantations. Given all these differences, extrapolation of a plantation model to natural loblolly stands cannot be justified on the basis of similar stand structures. On the other hand, the distributions of basal

area in natural loblolly and shortleaf pine stands are remarkably similar. Age structures and average amounts of hardwood competition are also alike, suggesting that, with recalibration of parameters, one model specification would probably suffice for both natural loblolly and shortleaf cover types. Distributions of these and other structural variables for more specific geographic areas can likewise be investigated with the tabular data. Additional information about the shape of distributions for two-way interactions between some of the structural variables can be gleaned from referencing the appropriate graphs (figs. 10A-64C).

Data contained in this document are also valuable as a guide to selecting samples for the purpose of modeling. Placement of samples to span one standard deviation of the mean assures **two-thirds** coverage of a normally distributed population; two standard deviations assures 95-percent coverage. Even when the assumption of normality deteriorates severely, 75 percent of the population will still fall within two standard deviations (Byrkit 1975). Knowledge concerning the shape of the distribution helps determine where to concentrate sampling to best conform to the target population.

a Includes 184,000 acres of planted stands.

b Includes 11,000 acres of planted stands.

c Includes 5,000 acres of planted stands.

d Includes 3,000 acres of planted stands.

e Includes planted and/or natural stands of eastern redcedar, sand pine, and spruce pine.

f Site indices for Georgia were not available at time of publication and are treated as missing values.

g Live trees 1.0 inch d.b.h. and larger.

h Yellow pine species only.

i Stand density indices of stands with no trees at least 1.0 inch d.b.h. are treated as missing values.

a Includes 90,000 acres of planted stands.

d Live trees 1.0 inch d.b.h. and larger.

b Includes 0 acres of planted stands.

e Yellow pine species only.

c Includes planted and natural sand pine stands.

f Stand density indices of stands with no trees at least 1.0 inch d.b.h. are treated as missing values.

a Includes 11,000 acres of planted stands.

f Site indices for Georgia were not available at time of publication and are treated as missing values.

b Includes 3,000 acres of planted stands.

g Live trees 1.0 inch d.b.h. and larger.

c Includes 5,000 acres of planted stands.

h Yellow pine species only.

d Includes 13,000 acres of planted stands.

i Stand density indices of stands with no trees at least 1.0 inch d.b.h. are treated as missing values.

e Includes planted and/or natural stands of eastern redcedar, pitch pine, sand pine, and white pine-hemlock.

54. Virginia pine	153		

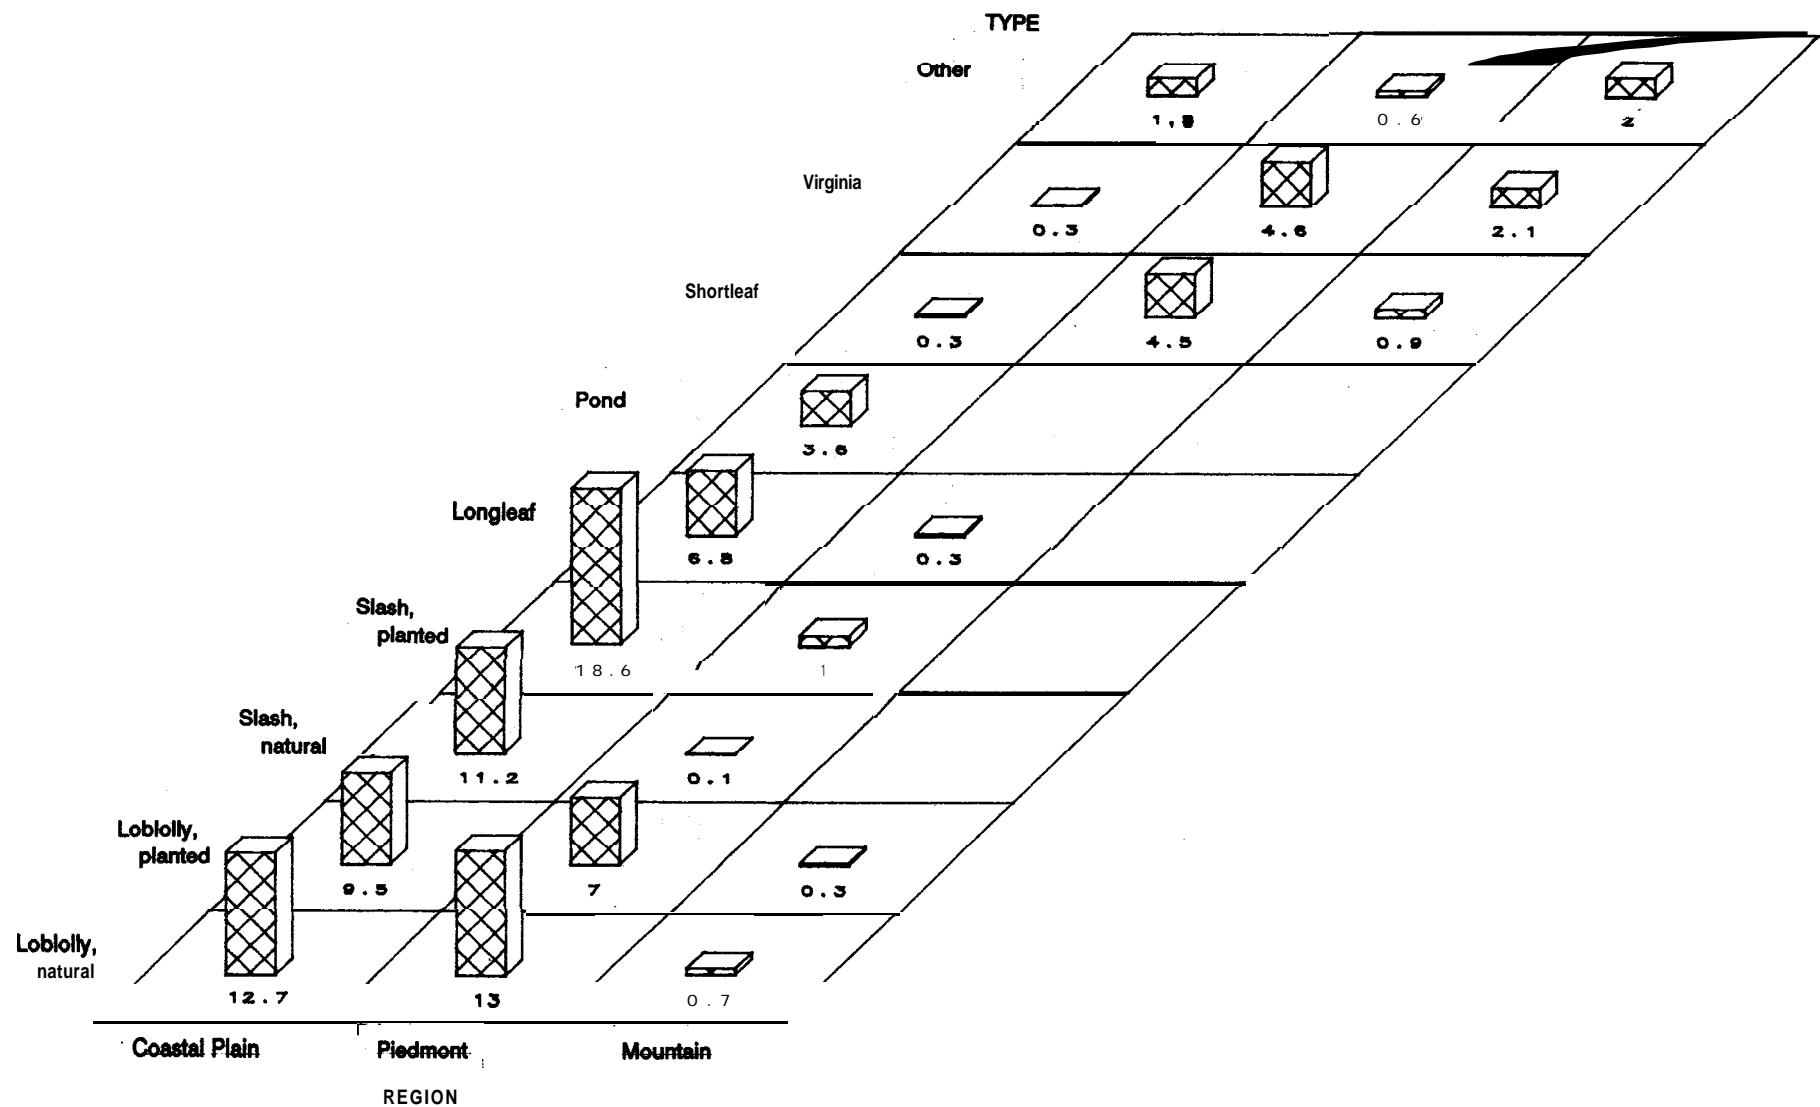

Figure 5.—Percentage distribution of pine timberland in the Southeast, by forest type and physiographii region. (Represents 34,103,117 acres.)

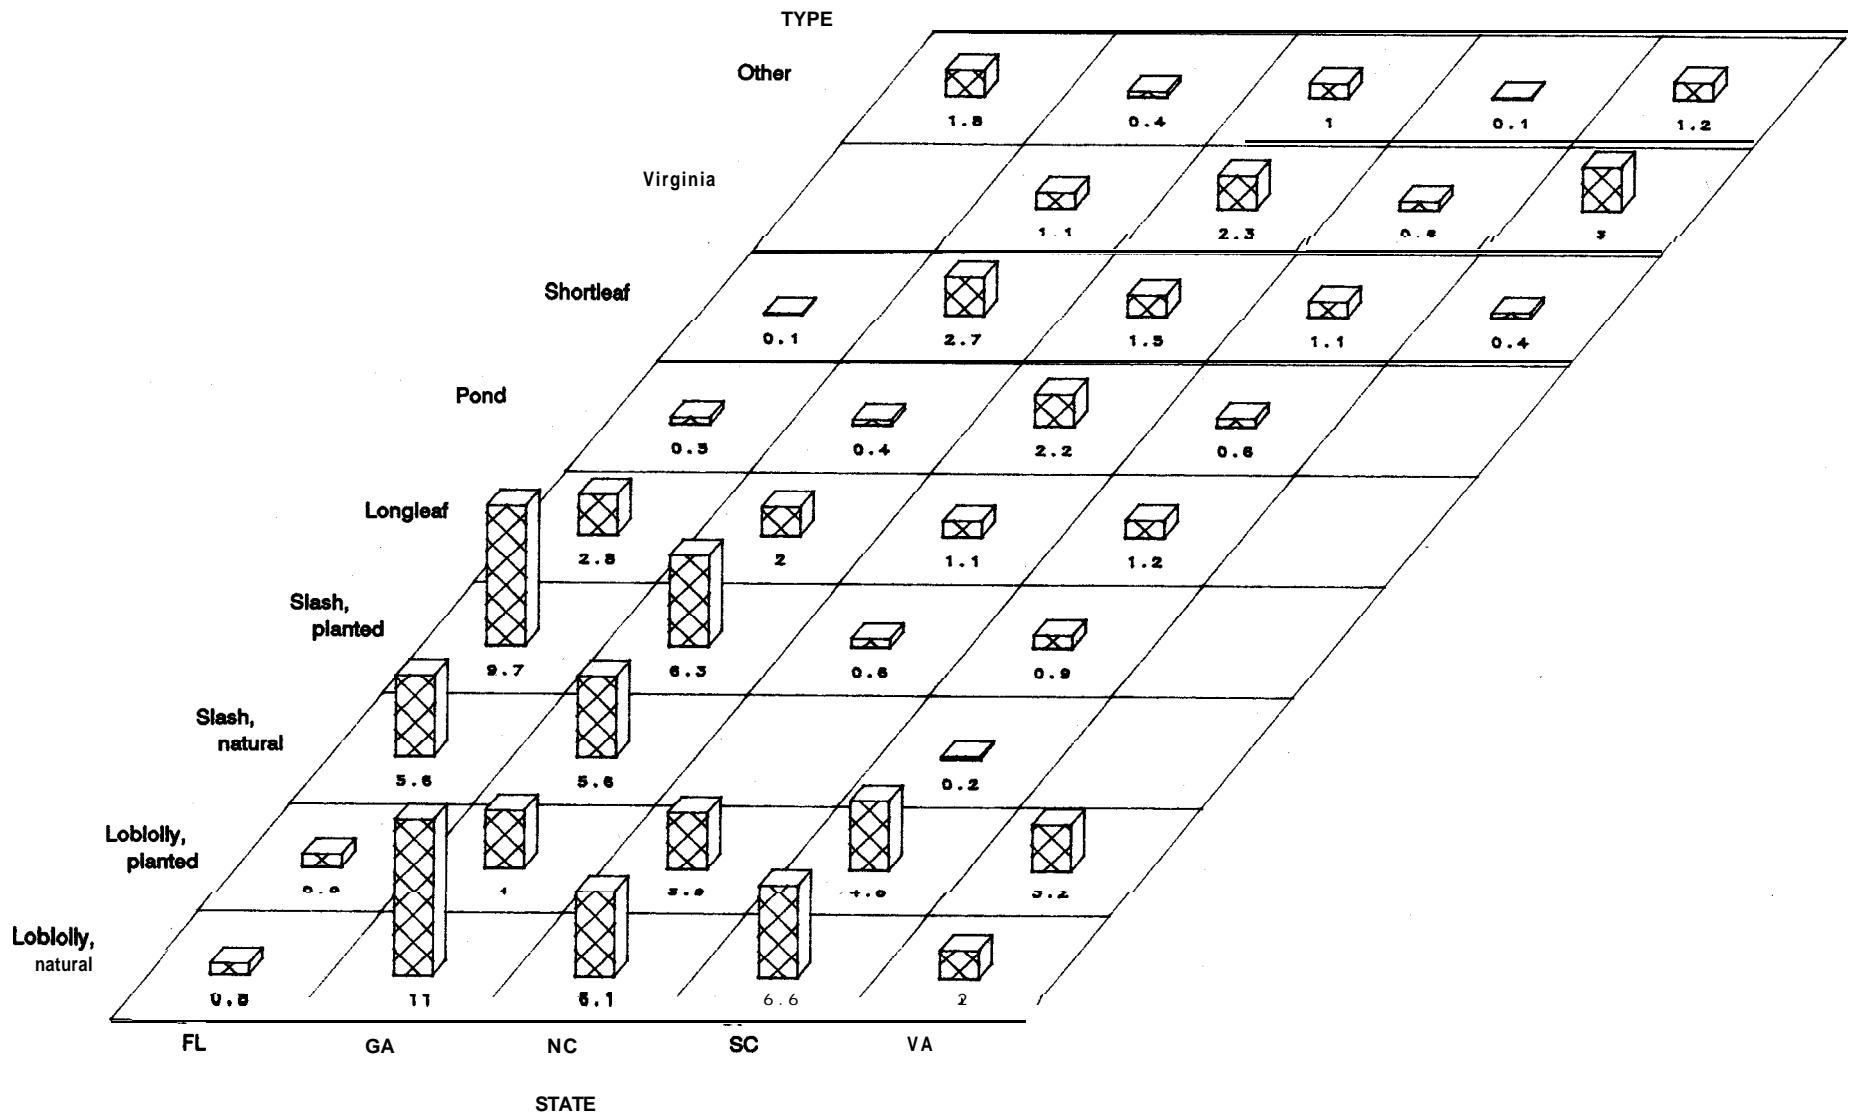

Figure B.-Percentage distribution of pine timberland in the Southeast, by forest type and State. (Represents 34,103,117 acres.)

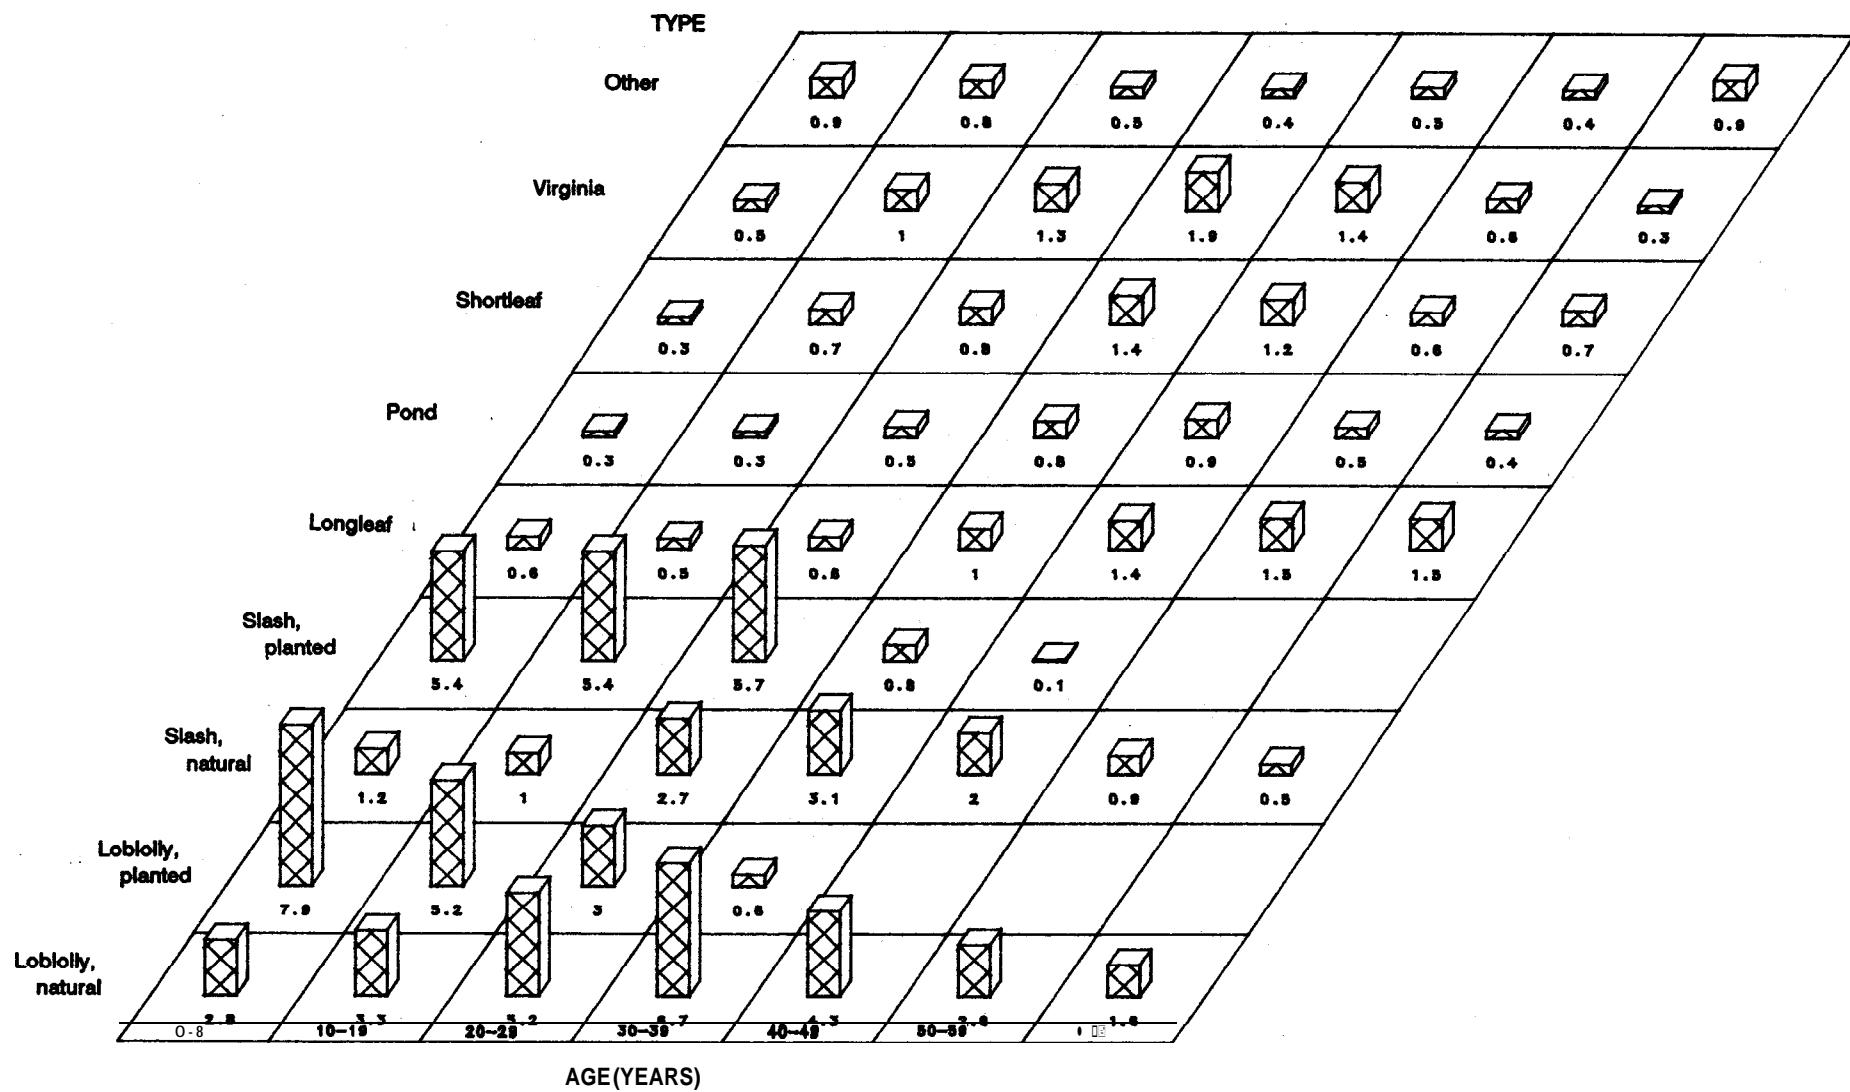

Figure 7.—Percentage distribution of pine timberland in the Southeast, by forest type and stand age. (Represents 34,103,117 acres.)

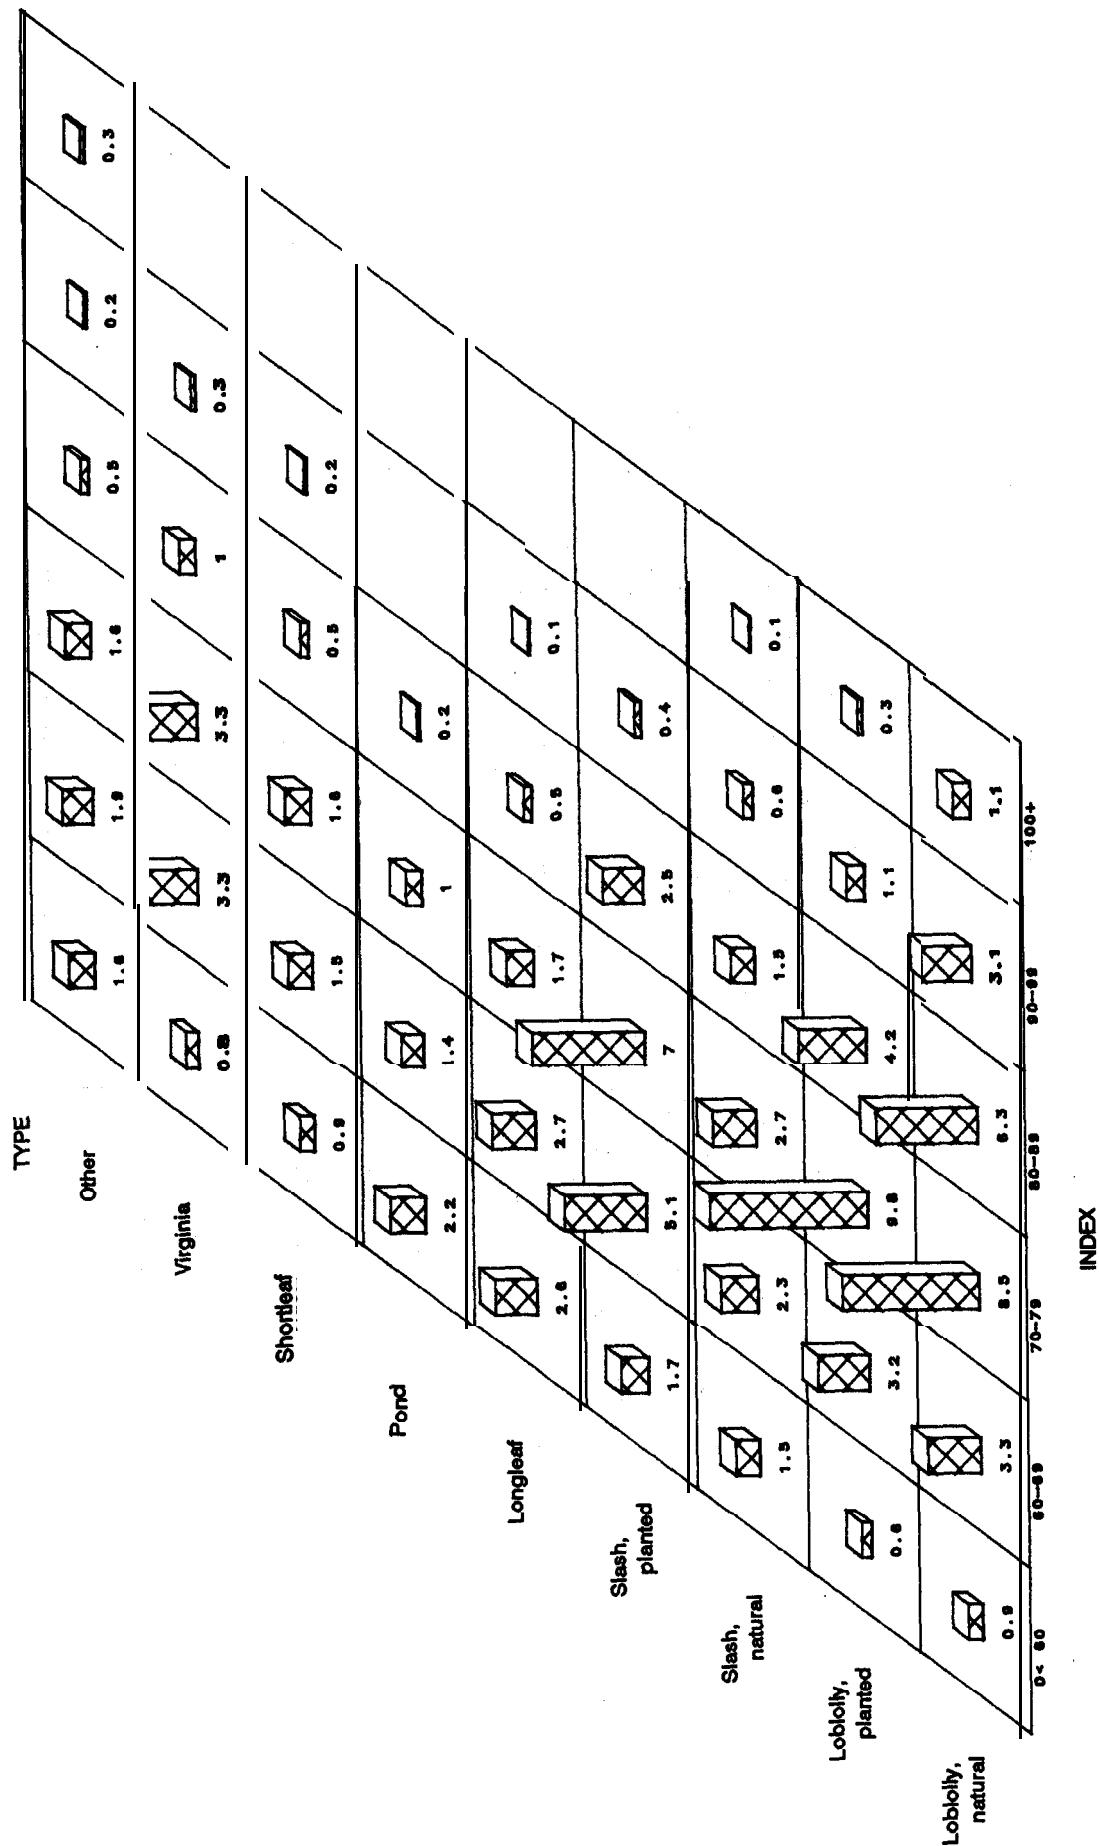

Figure 8.—Percentage distribution of pine timberland in the Southeast, by forest type and site index. (Represents 34,103,117 acres.
Georgia site index data treated as missing values.)

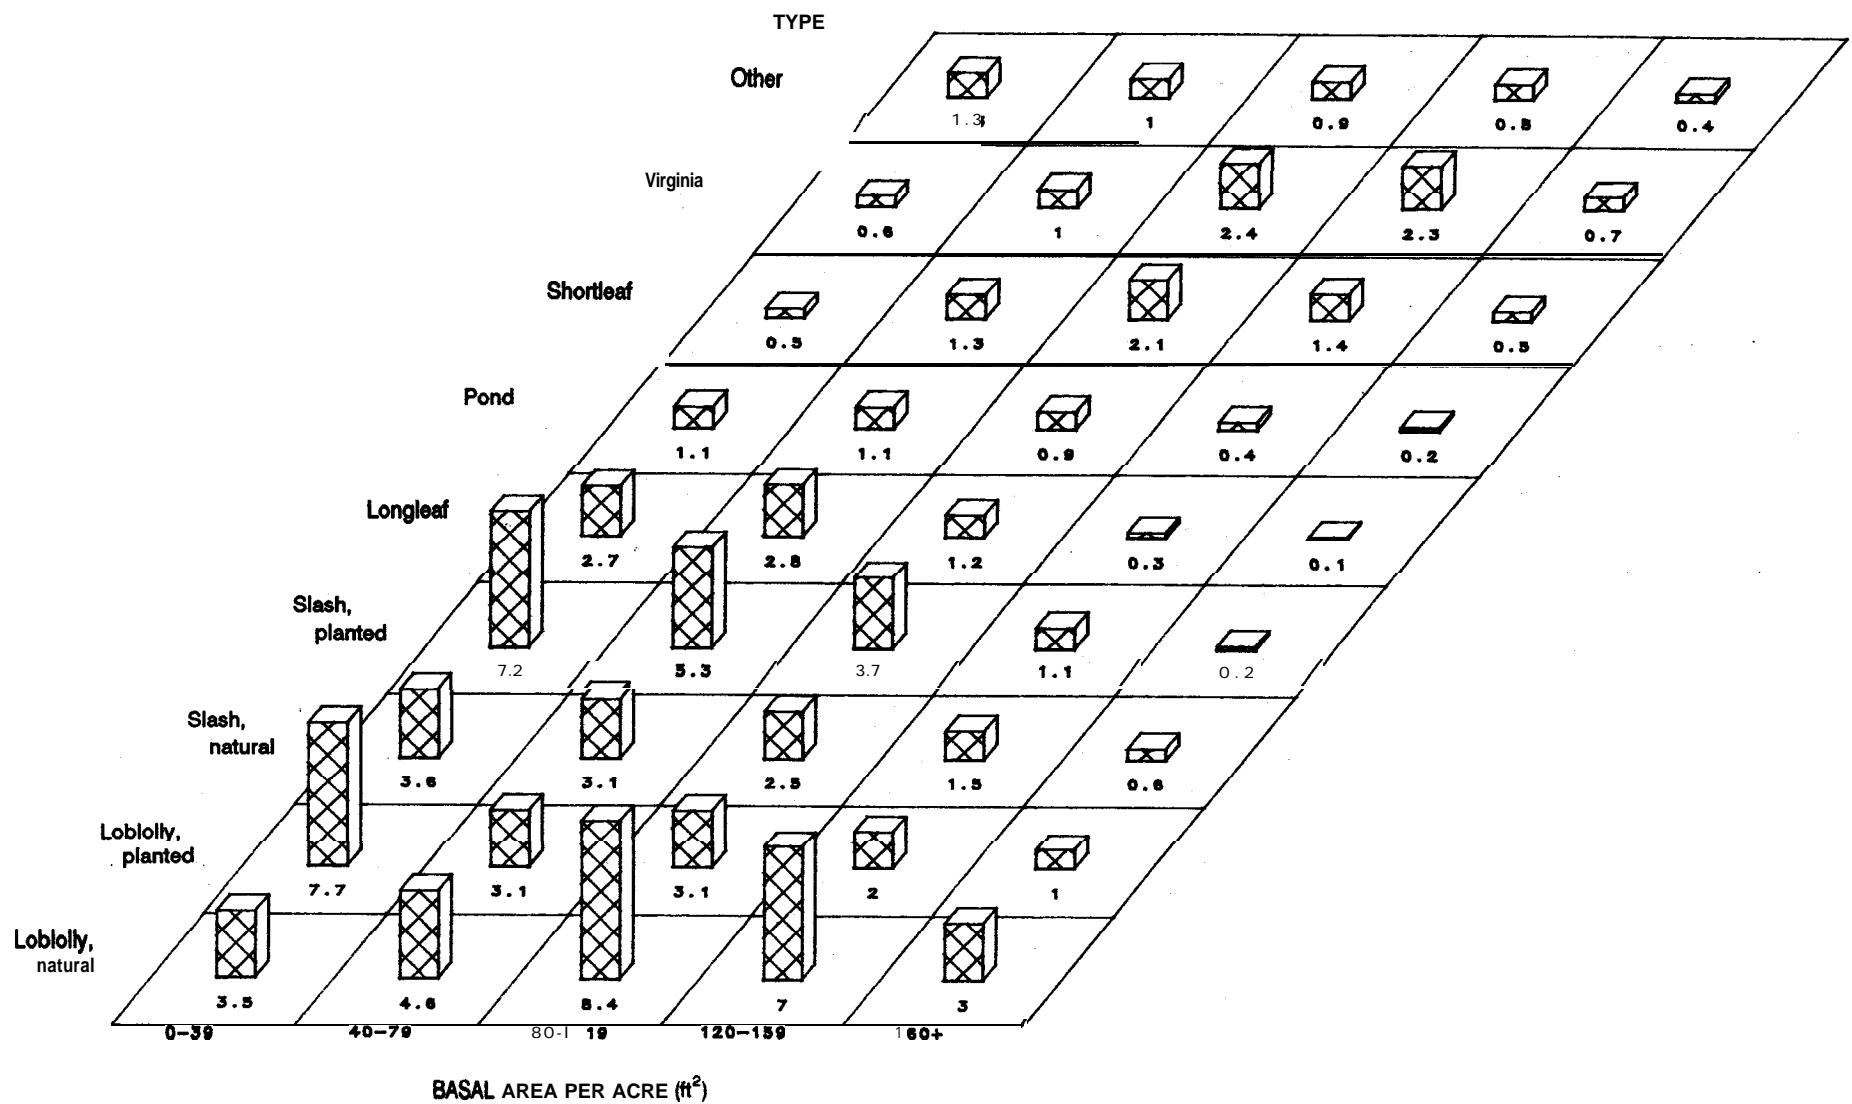

Figure O.-Percentage distribution of pine timberland in the Southeast, by forest type and basal area per acre. (Represents 34,103,117 acres.)

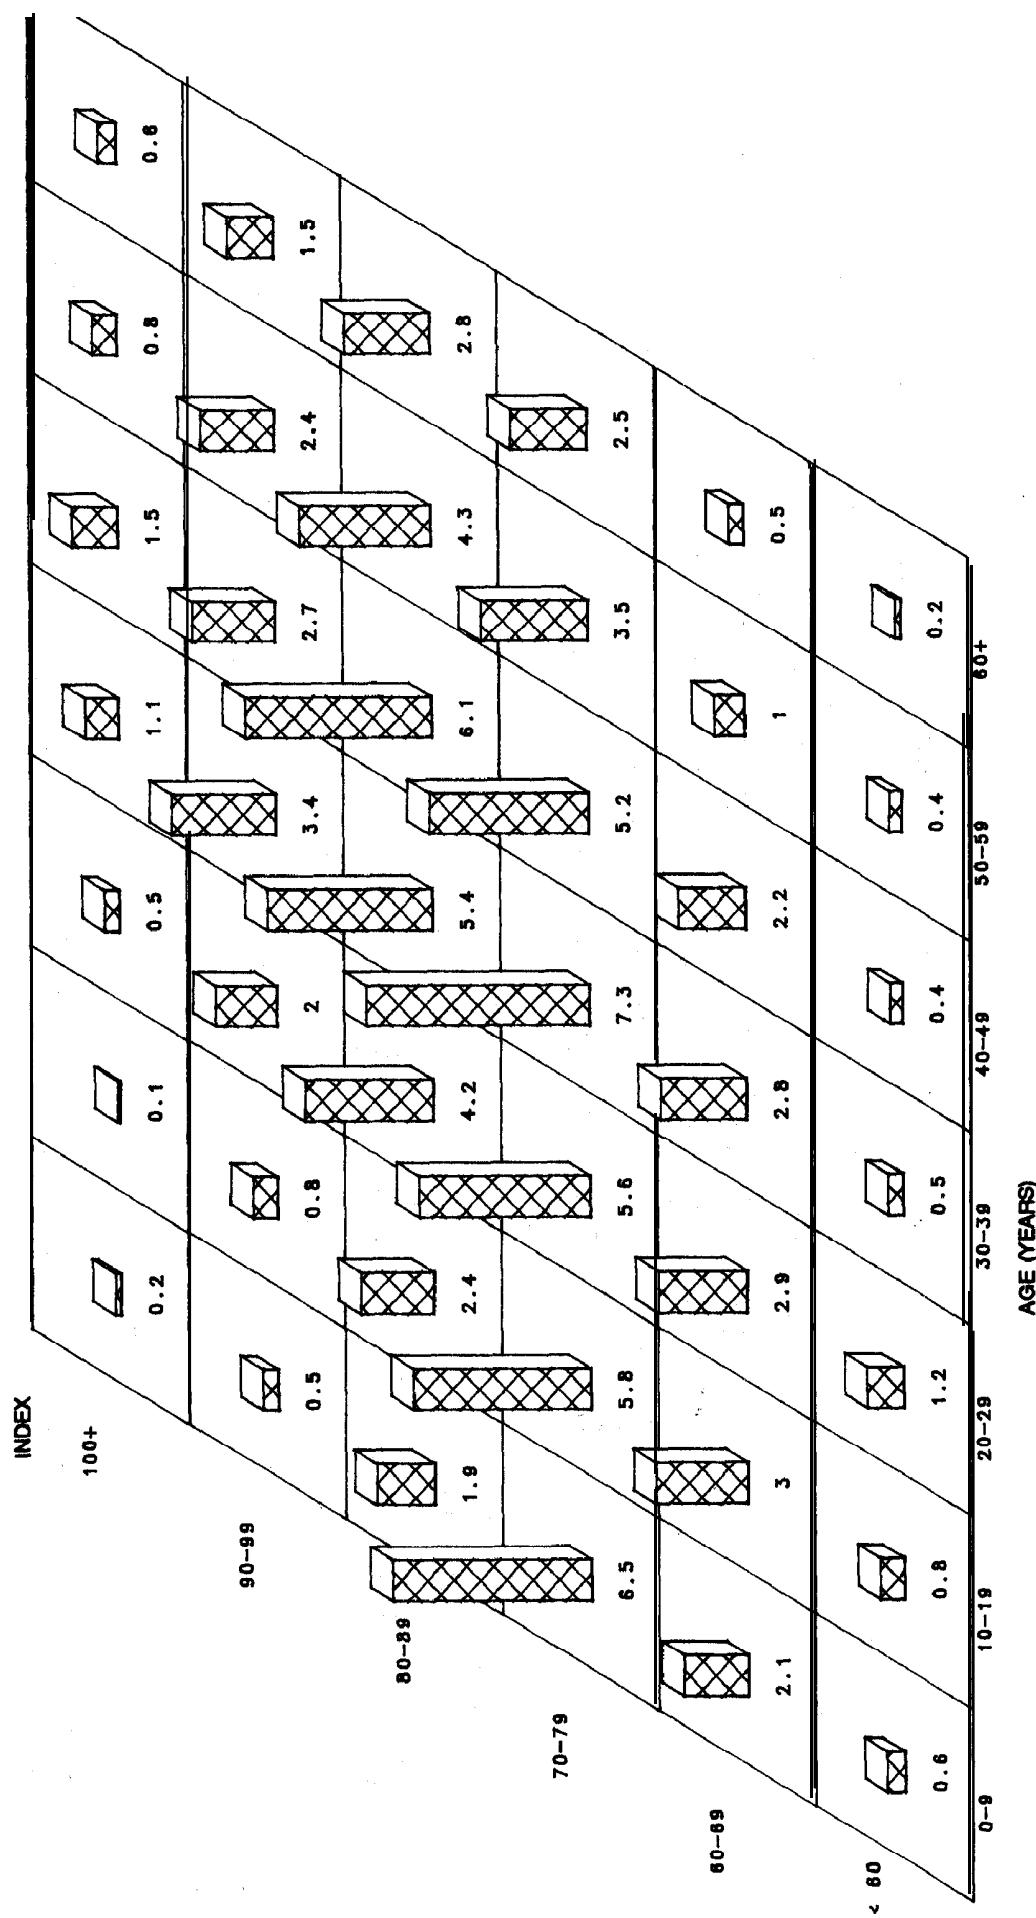

Figure 10A.—Percentage distribution of natural loblolly pine stands in the Southeast, by site index and stand age. (Represents 9,011.884 acres. Georgia site
Index data treated as missing values.)

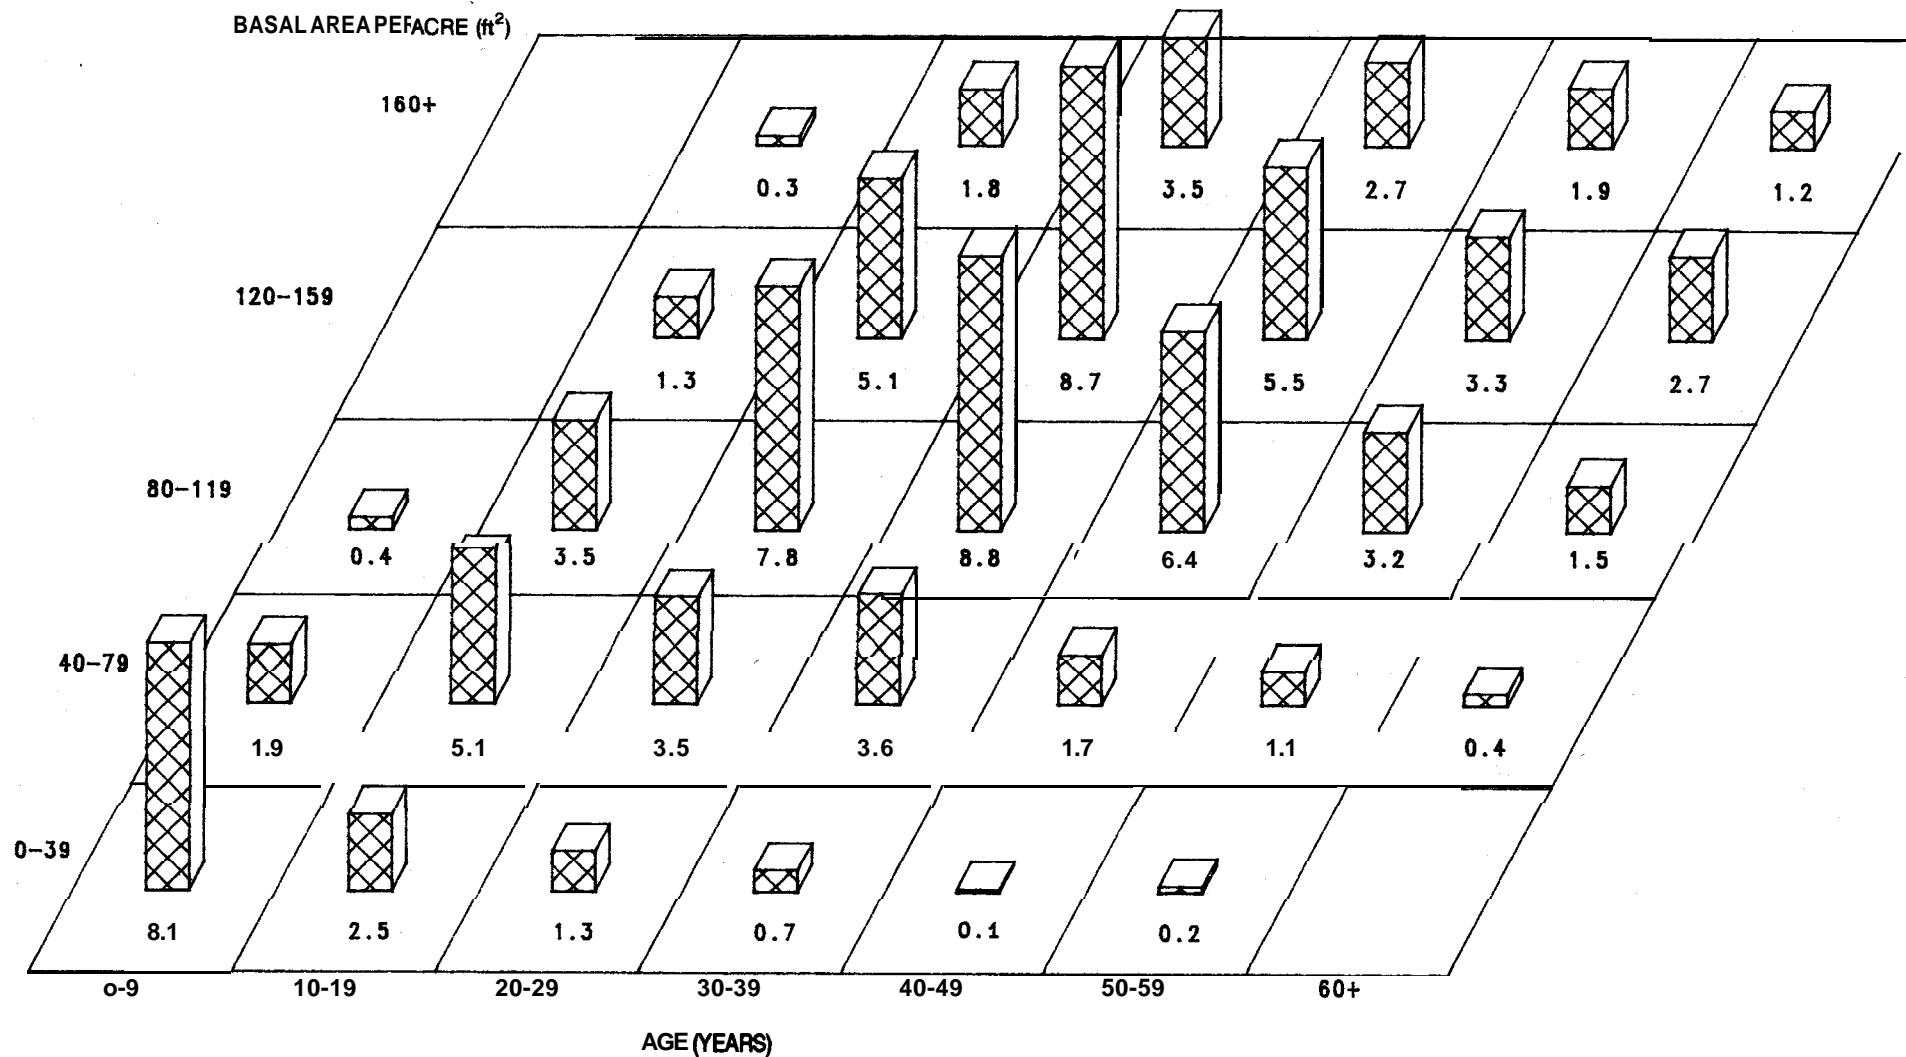

Figure IOB.-Percentage distribution of natural loblolly pine stands in the Southeast, by basal area and stand age. (Represents 9,011,684 acres.)

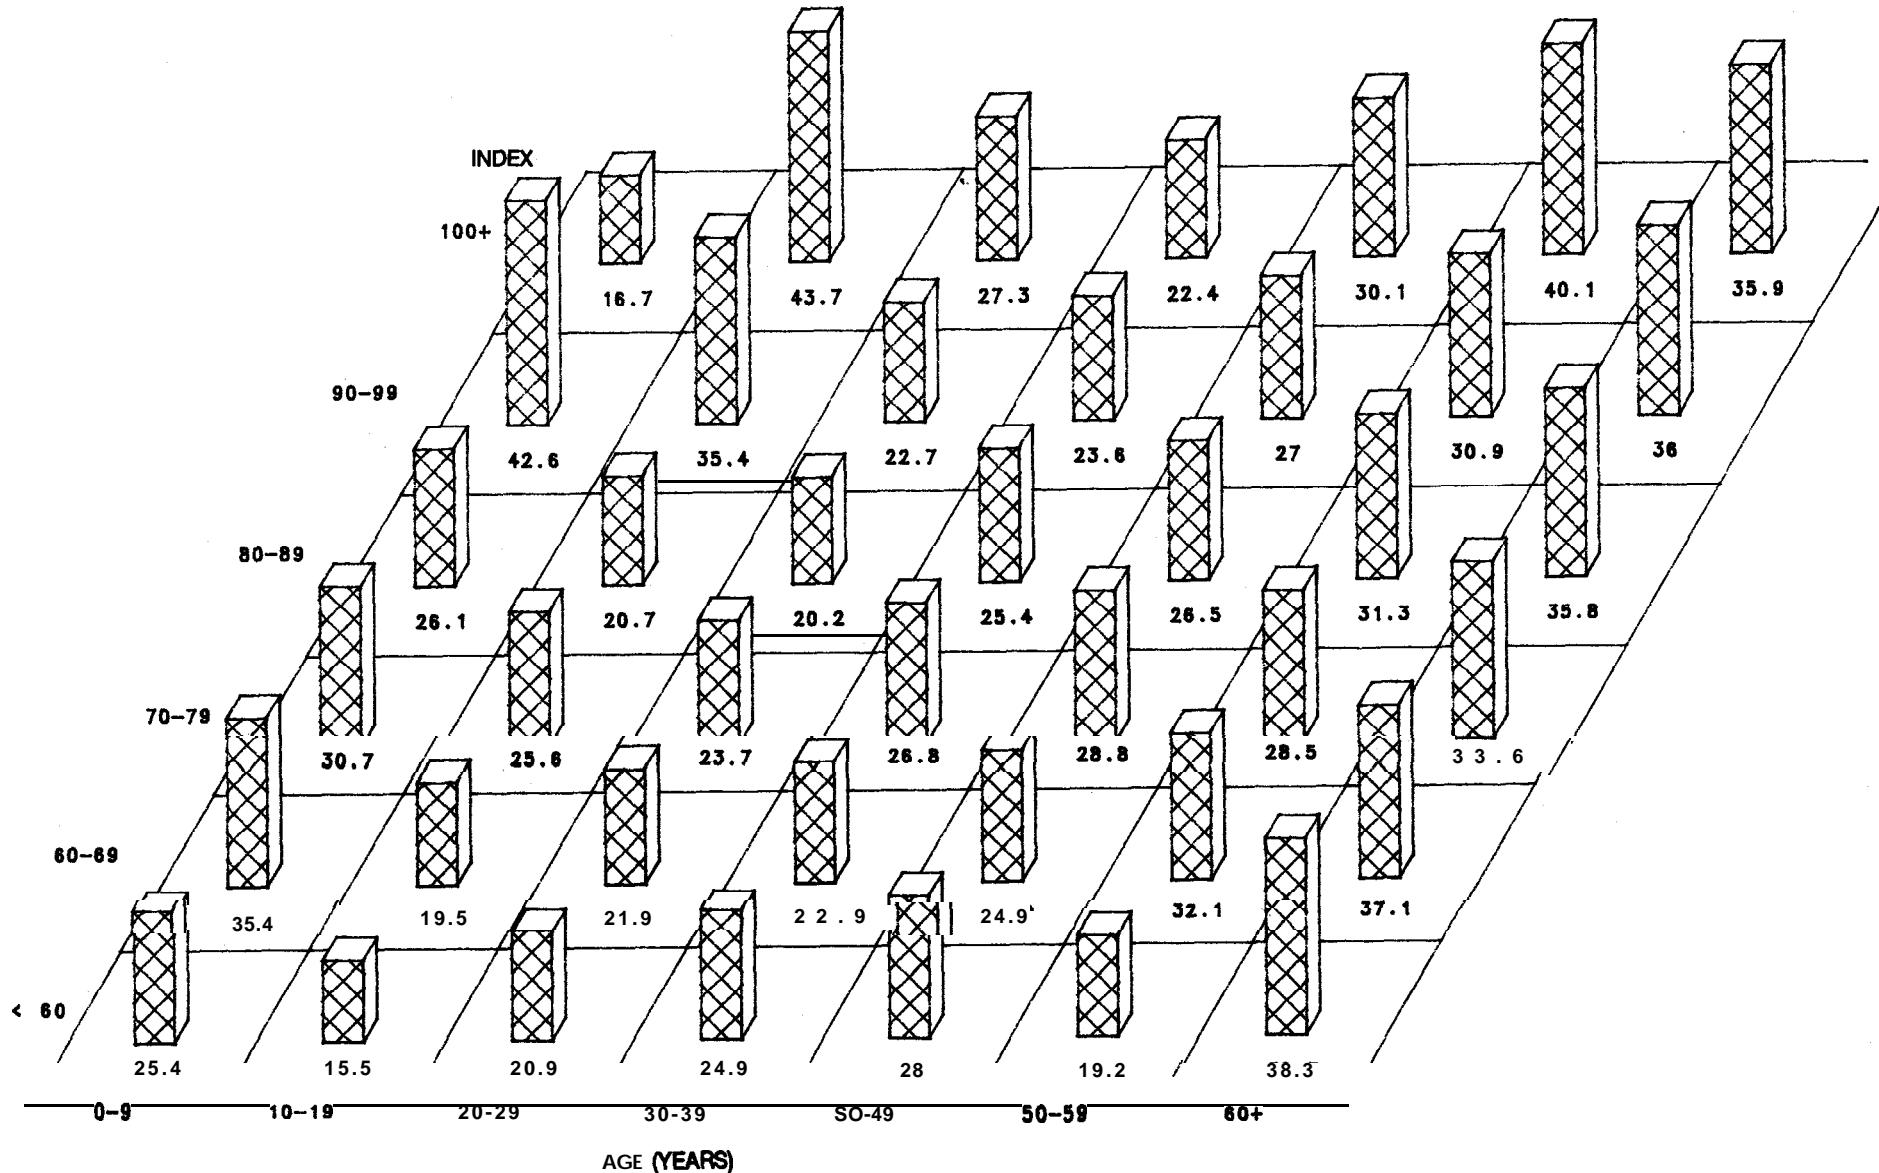

Figure 10C.—Percentage distribution of basal area per acre in non-yellow-pine species, by site index and stand age, for natural loblolly pine stands in the Southeast. (Represents 9,011,884 acres. Georgia site index data treated as missing values.)

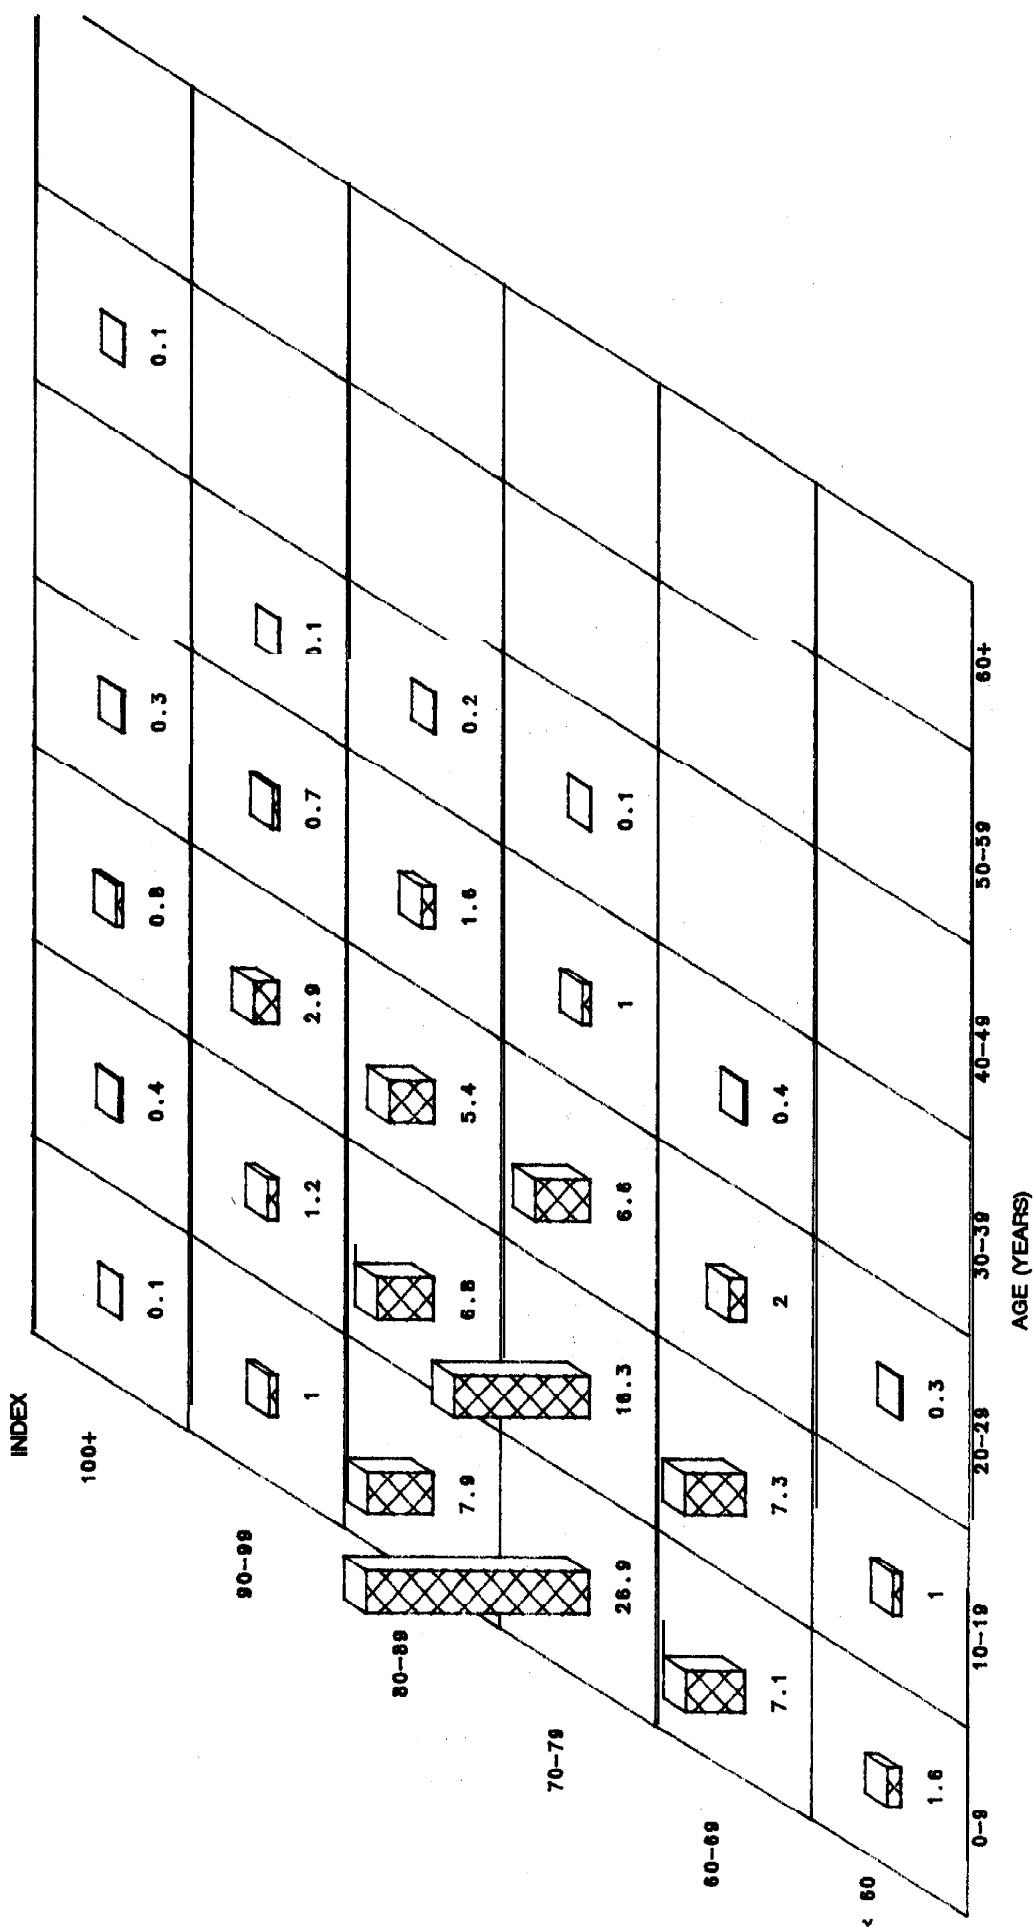

Figure 11A.—Percentage distribution of planted loblolly pine stands in the Southeast, by site index and stand age. (Represents 5,749,124 acres, Georgia site index treated as missing values.)

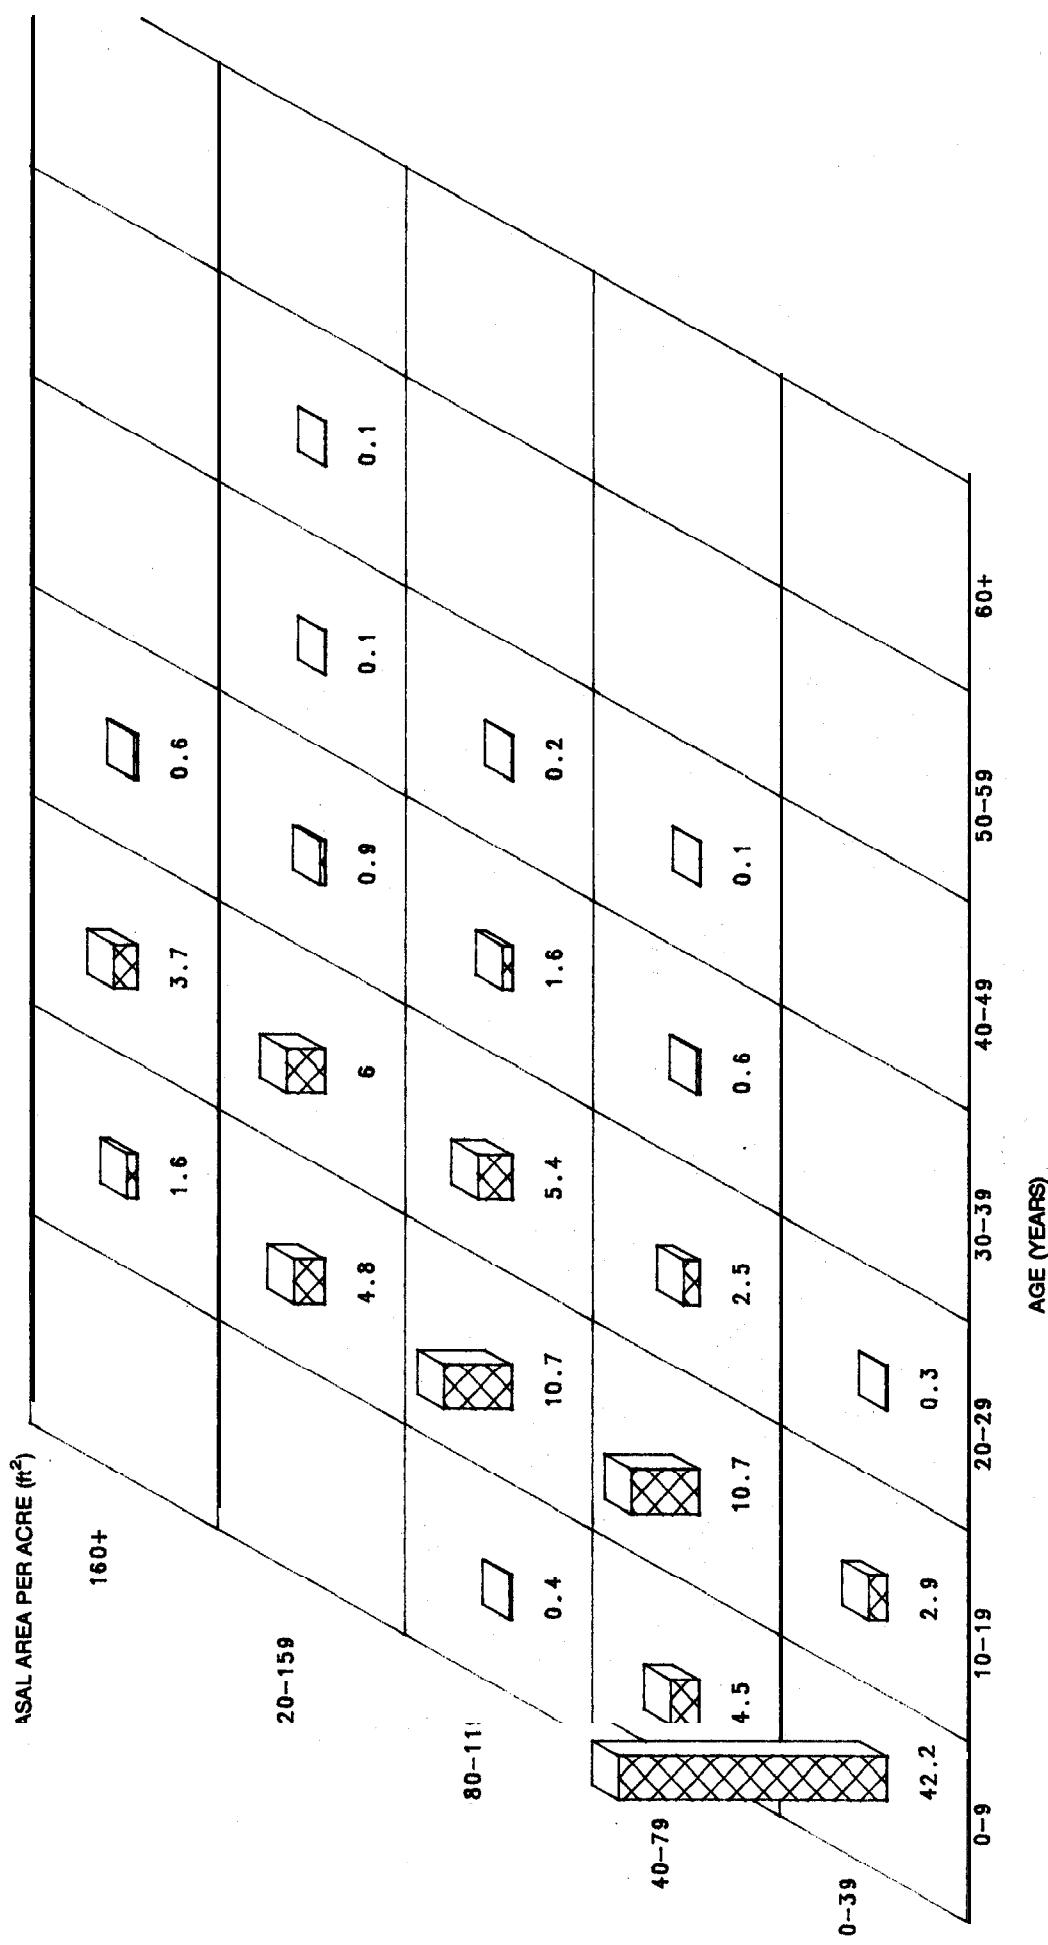

Figure 11B.—Percentage distribution of planted loblolly pine stands in the Southeast, by basal area per acre and stand age. (Represents 5,749,124 acres.)

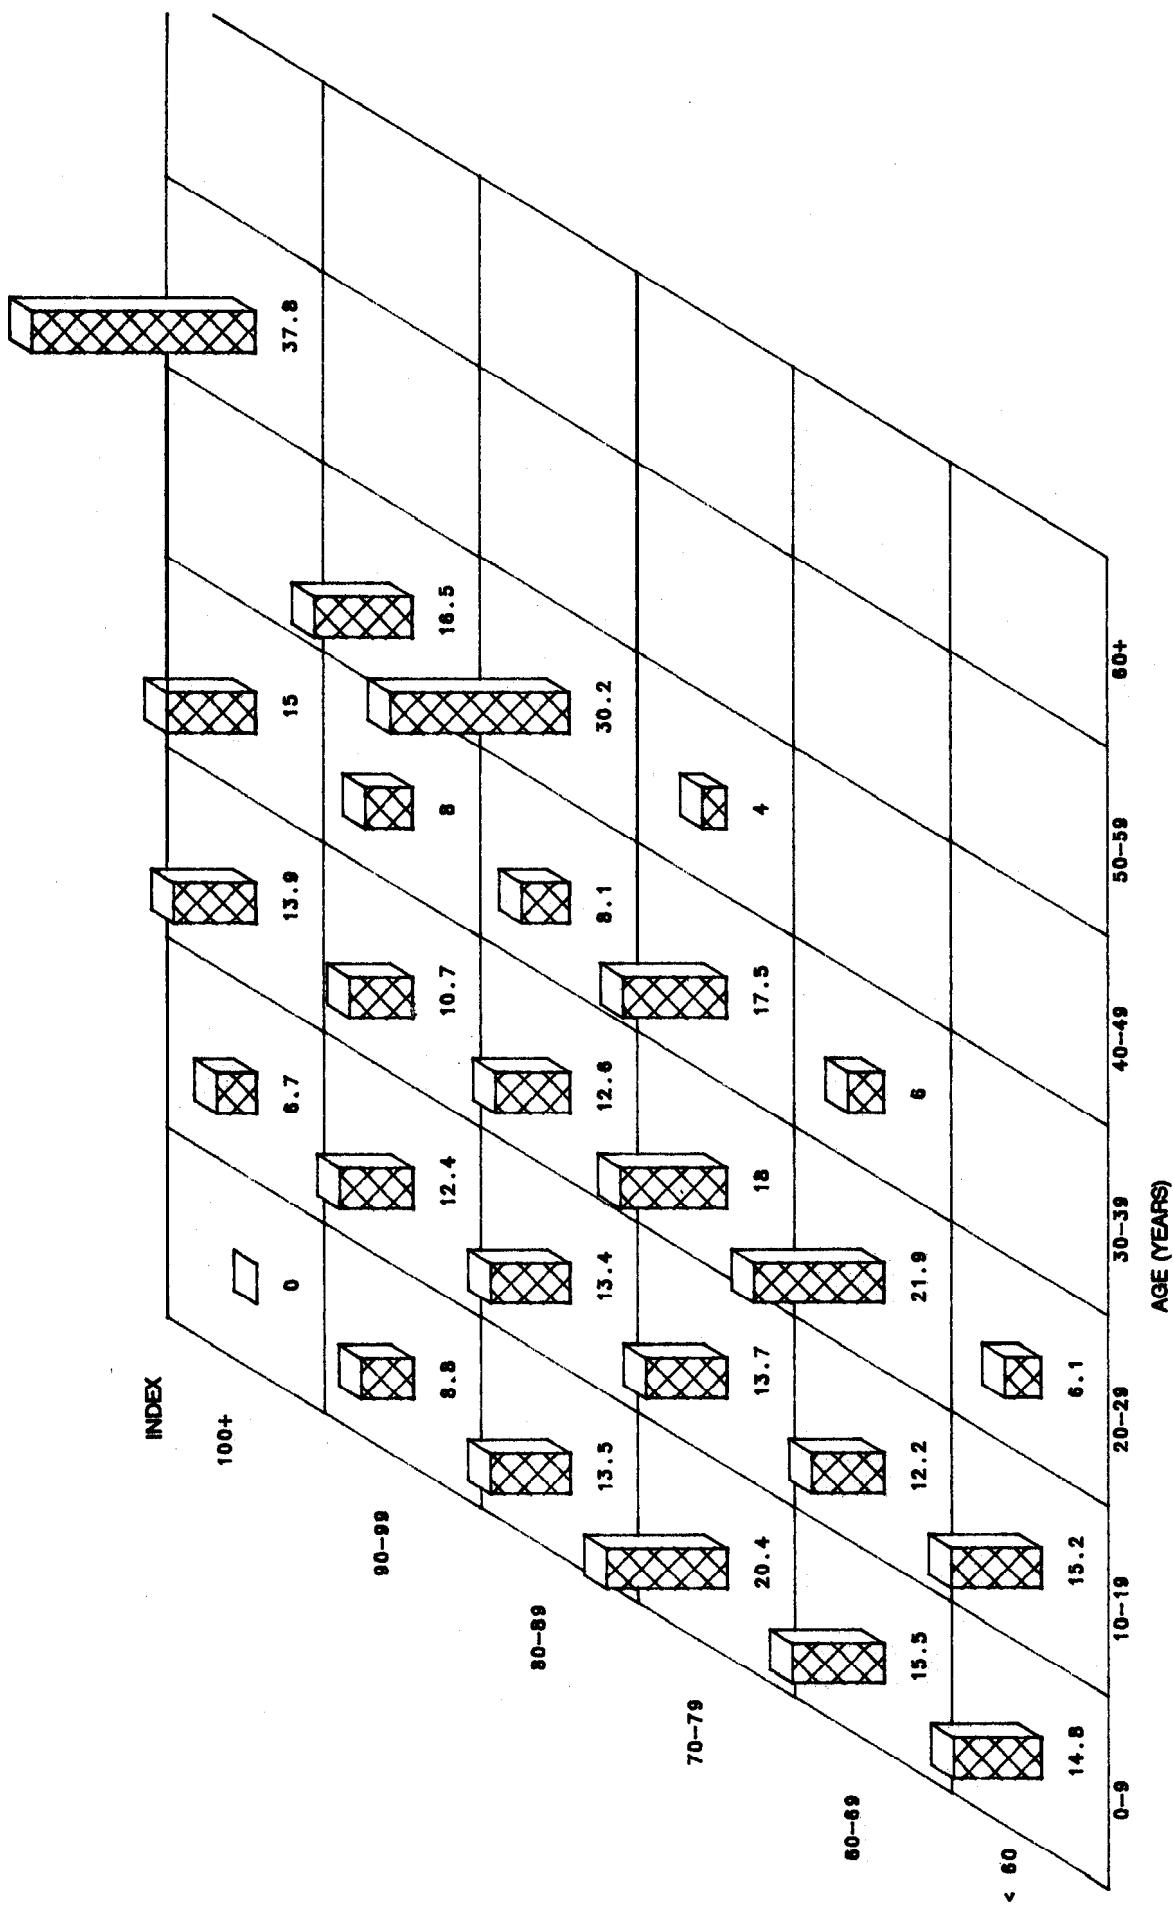

Figure 11C.—Percentage distribution of basal area per acre in non-yellow-pine species, by site index and stand age, for planted loblolly pine stands in the Southeast. (Represents 5,749,124 acres. Georgia site index data treated as missing values.)

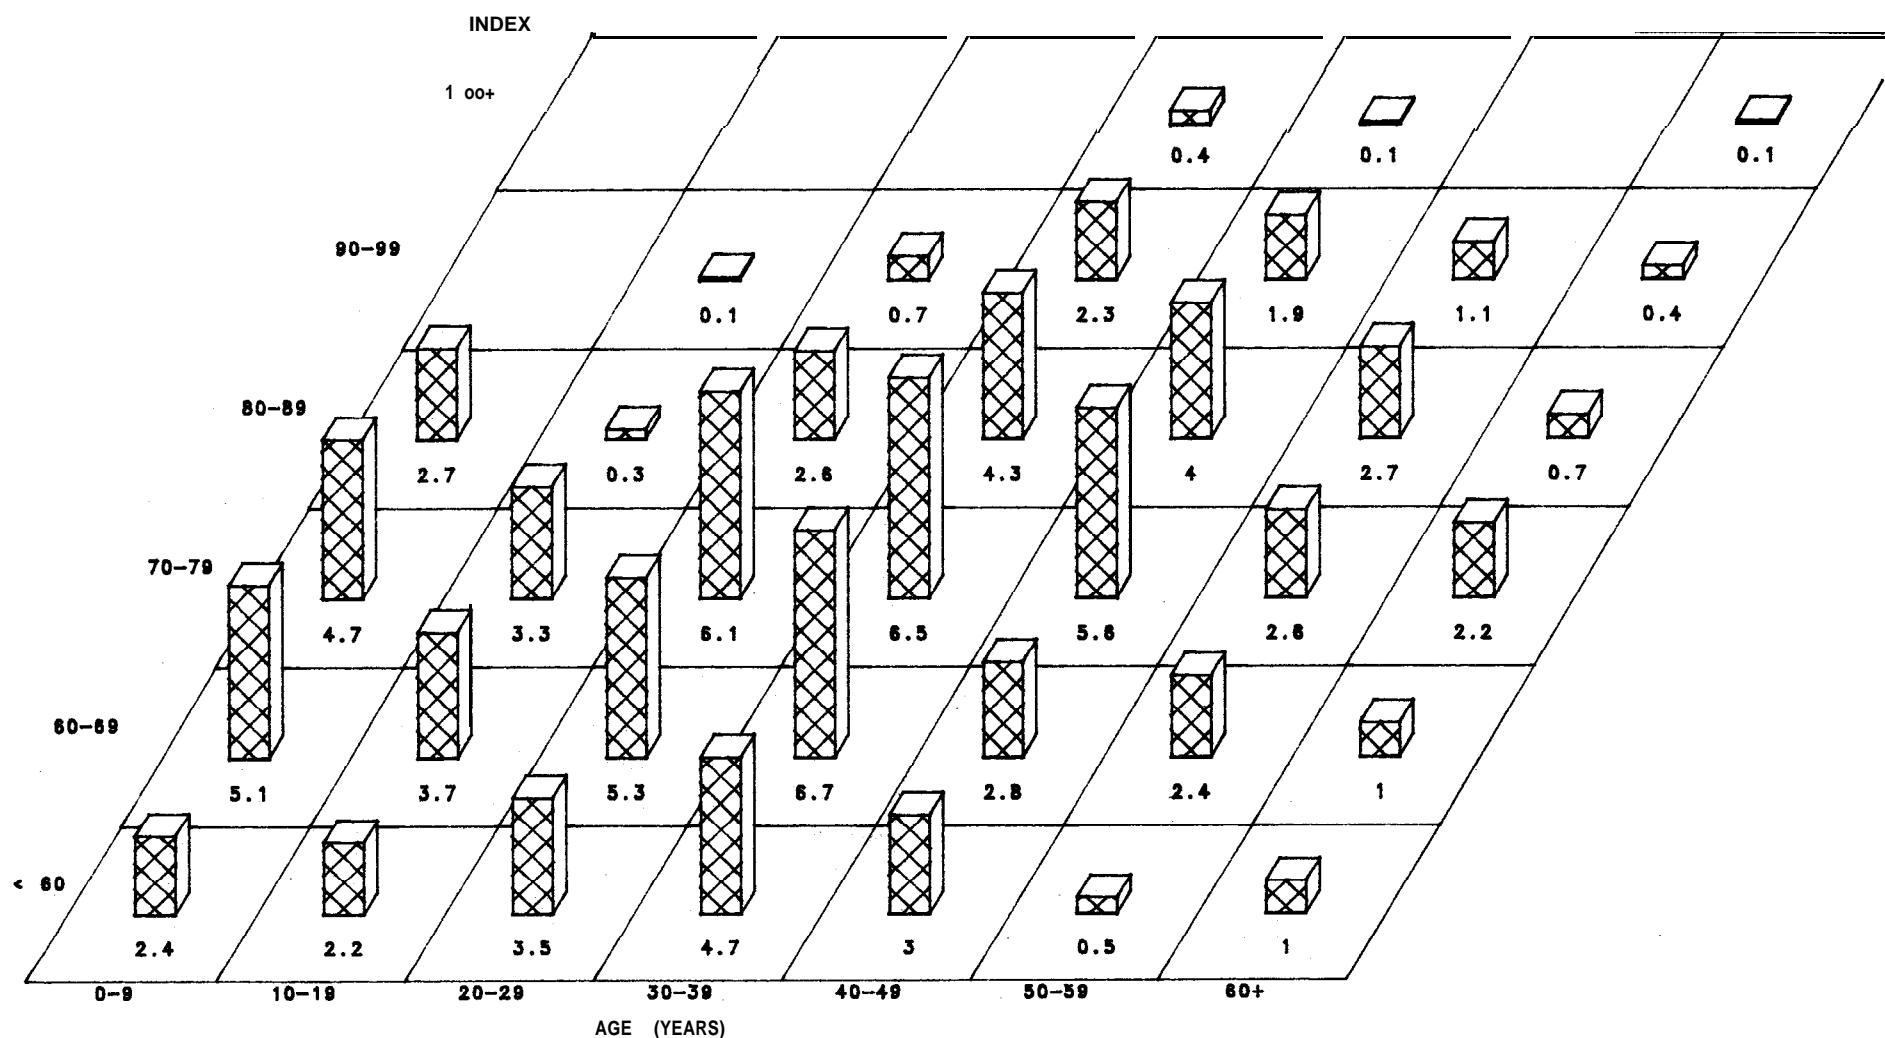

Figure 12A.—Percentage distribution of natural slash pine stands in the Southeast, by site index and stand age. (Represents 3,868,669 acres. Georgia site index data treated as missing values.)

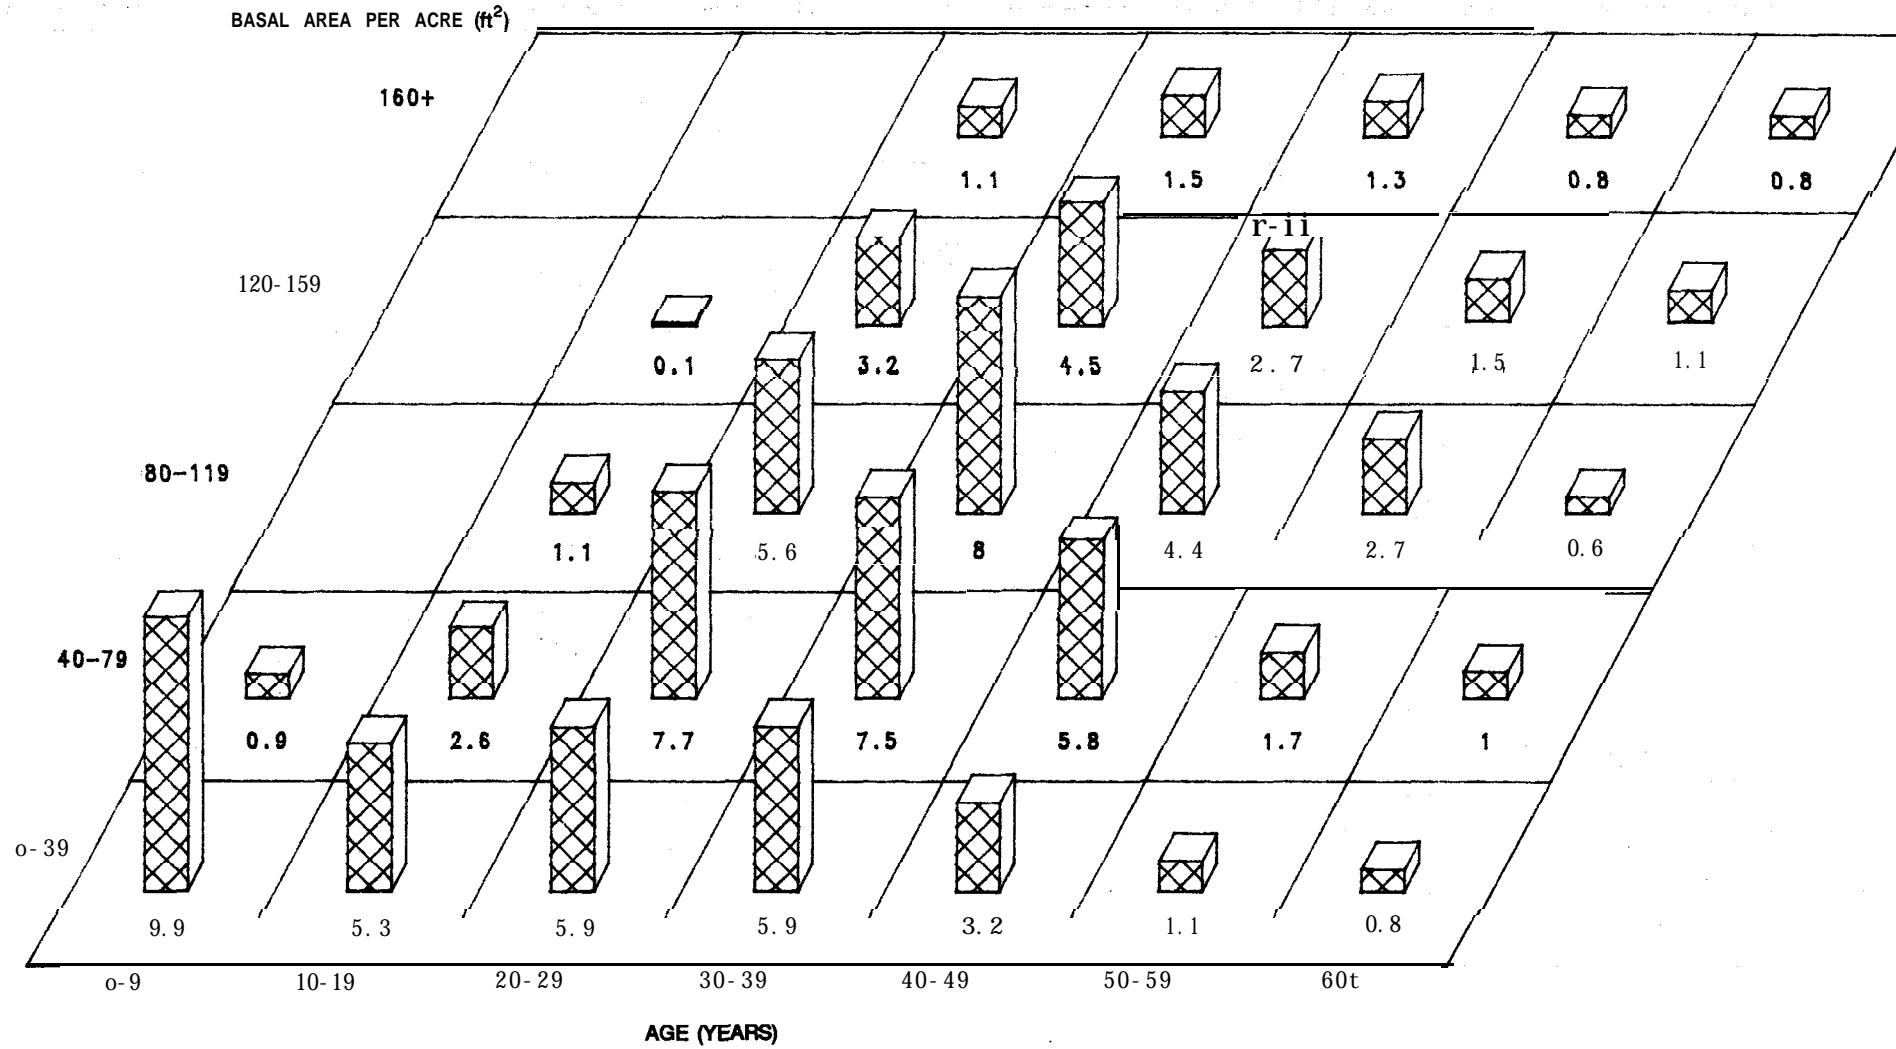

Figure 12B.—Percentage distribution of natural slash pine stands in the Southeast, by basal area per acre and stand age. (Represents 3,868,669 acres.)

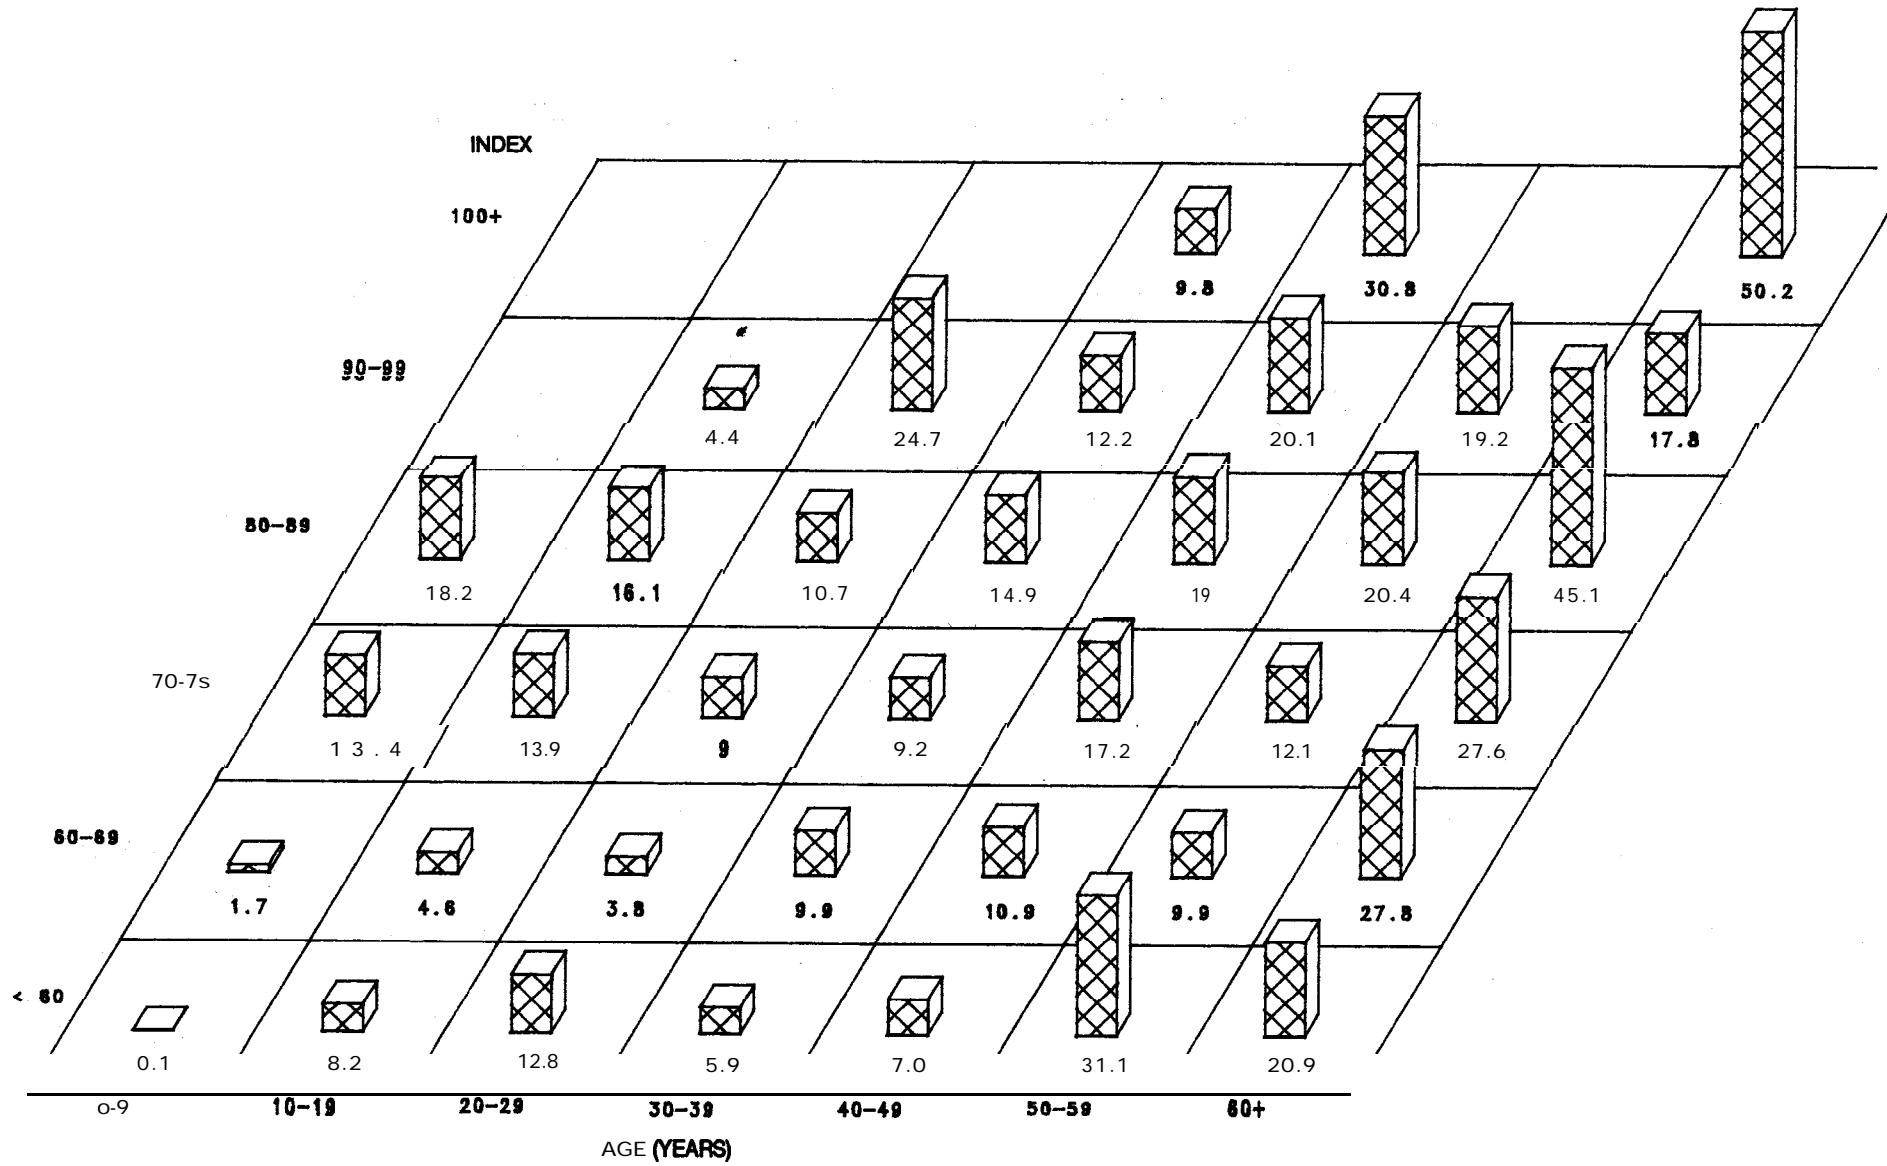

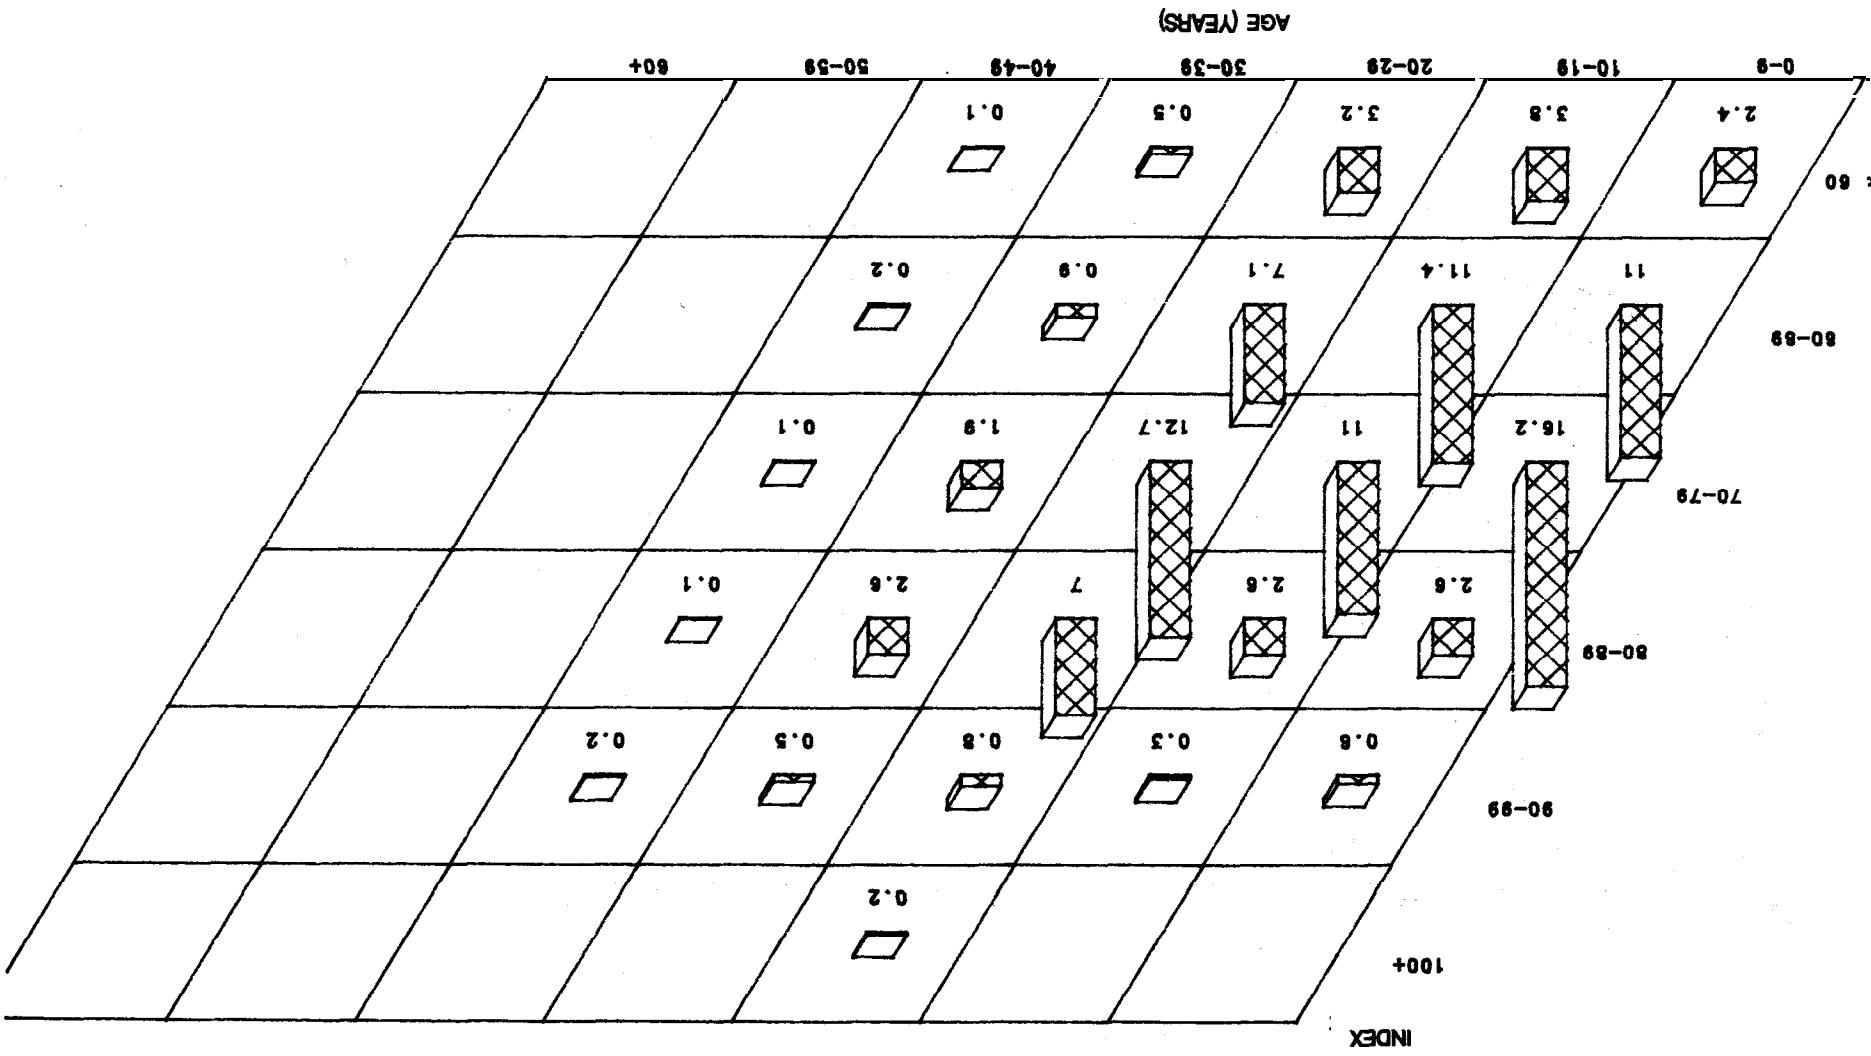

Figure 12C.--Percentage of basal area per acre in **non-yellow-pine** species, by site index and stand age, for natural slash pine stands in the Southeast.
(Represents 3,868,669 acres. Georgia site index data treated as missing values.)

Figure 13A.—Percentage distribution of planted slash pine stands in the Southeast, by site index and stand age. (Represents 5,956,523 acres, Georgia site index data treated as missing values.)

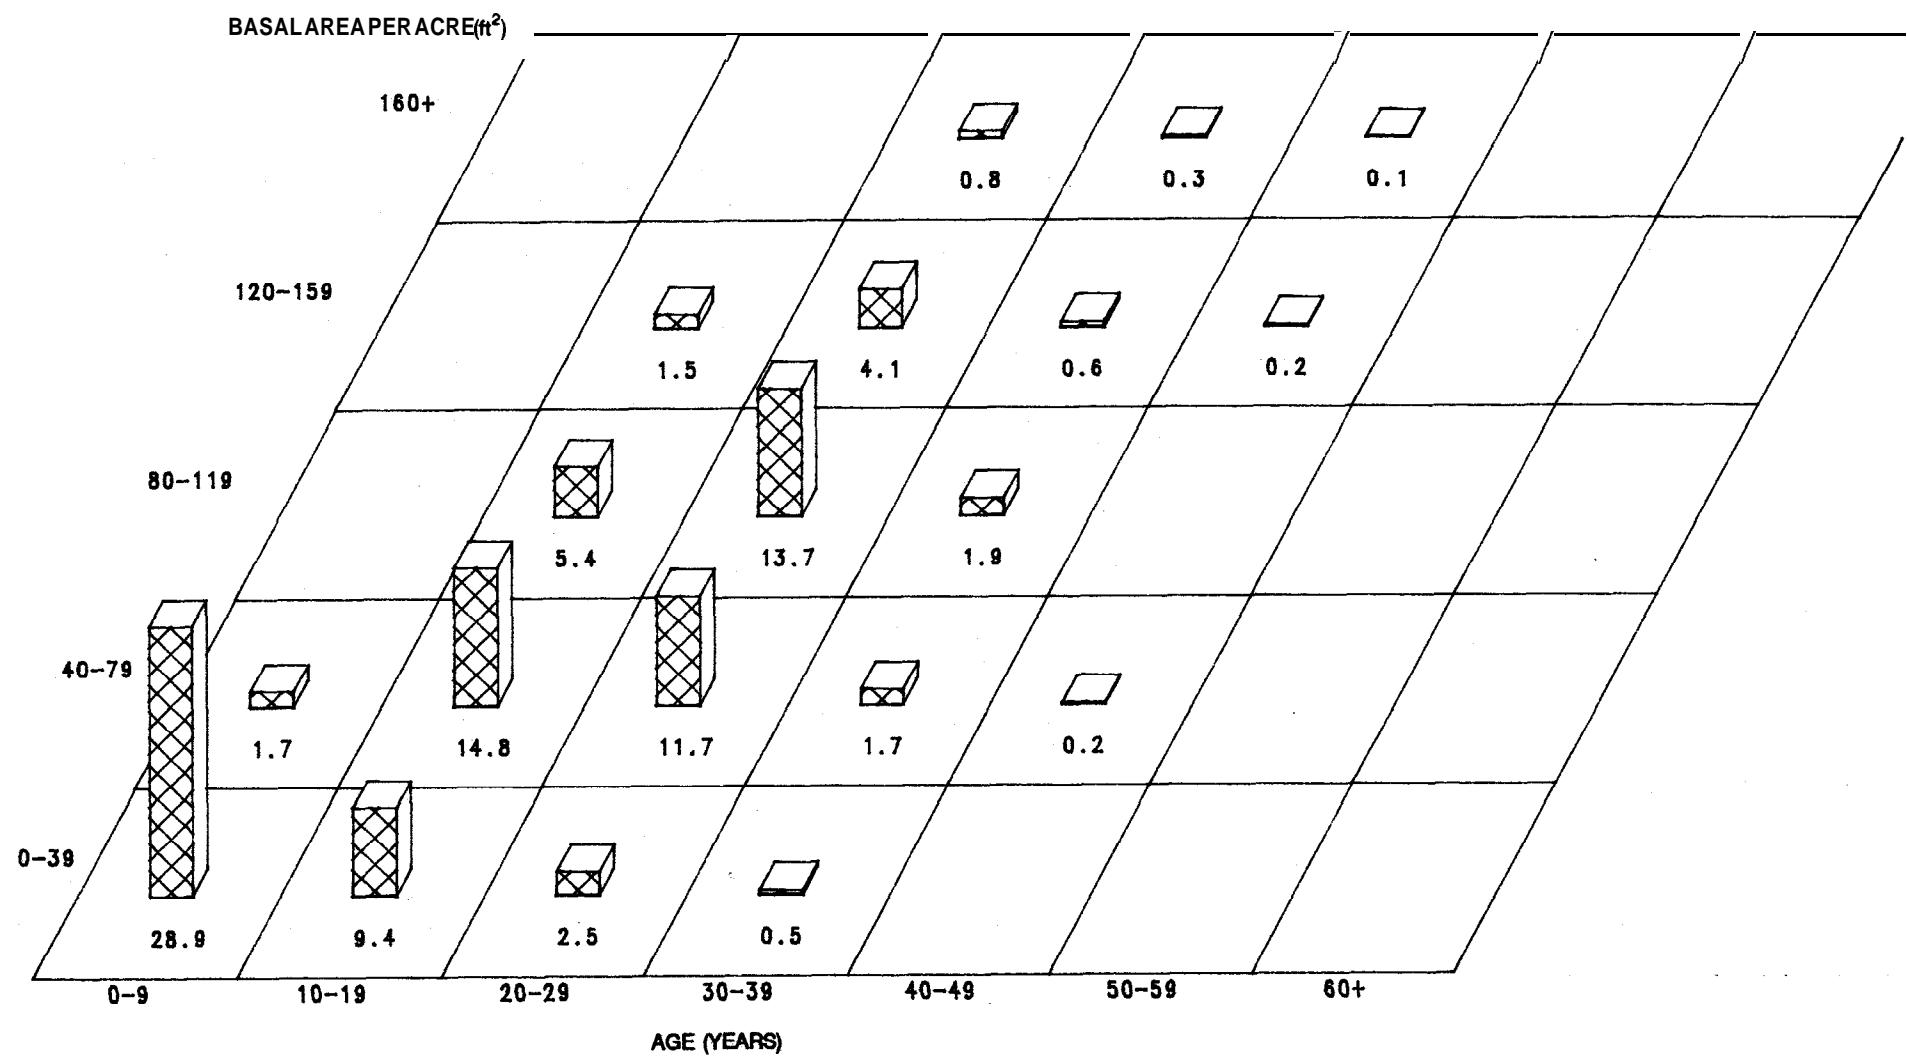

Figure 13B.—Percentage distribution of planted slash pine stands in the Southeast, by basal area per acre and stand age. (Represents 5,956,523 acres.)

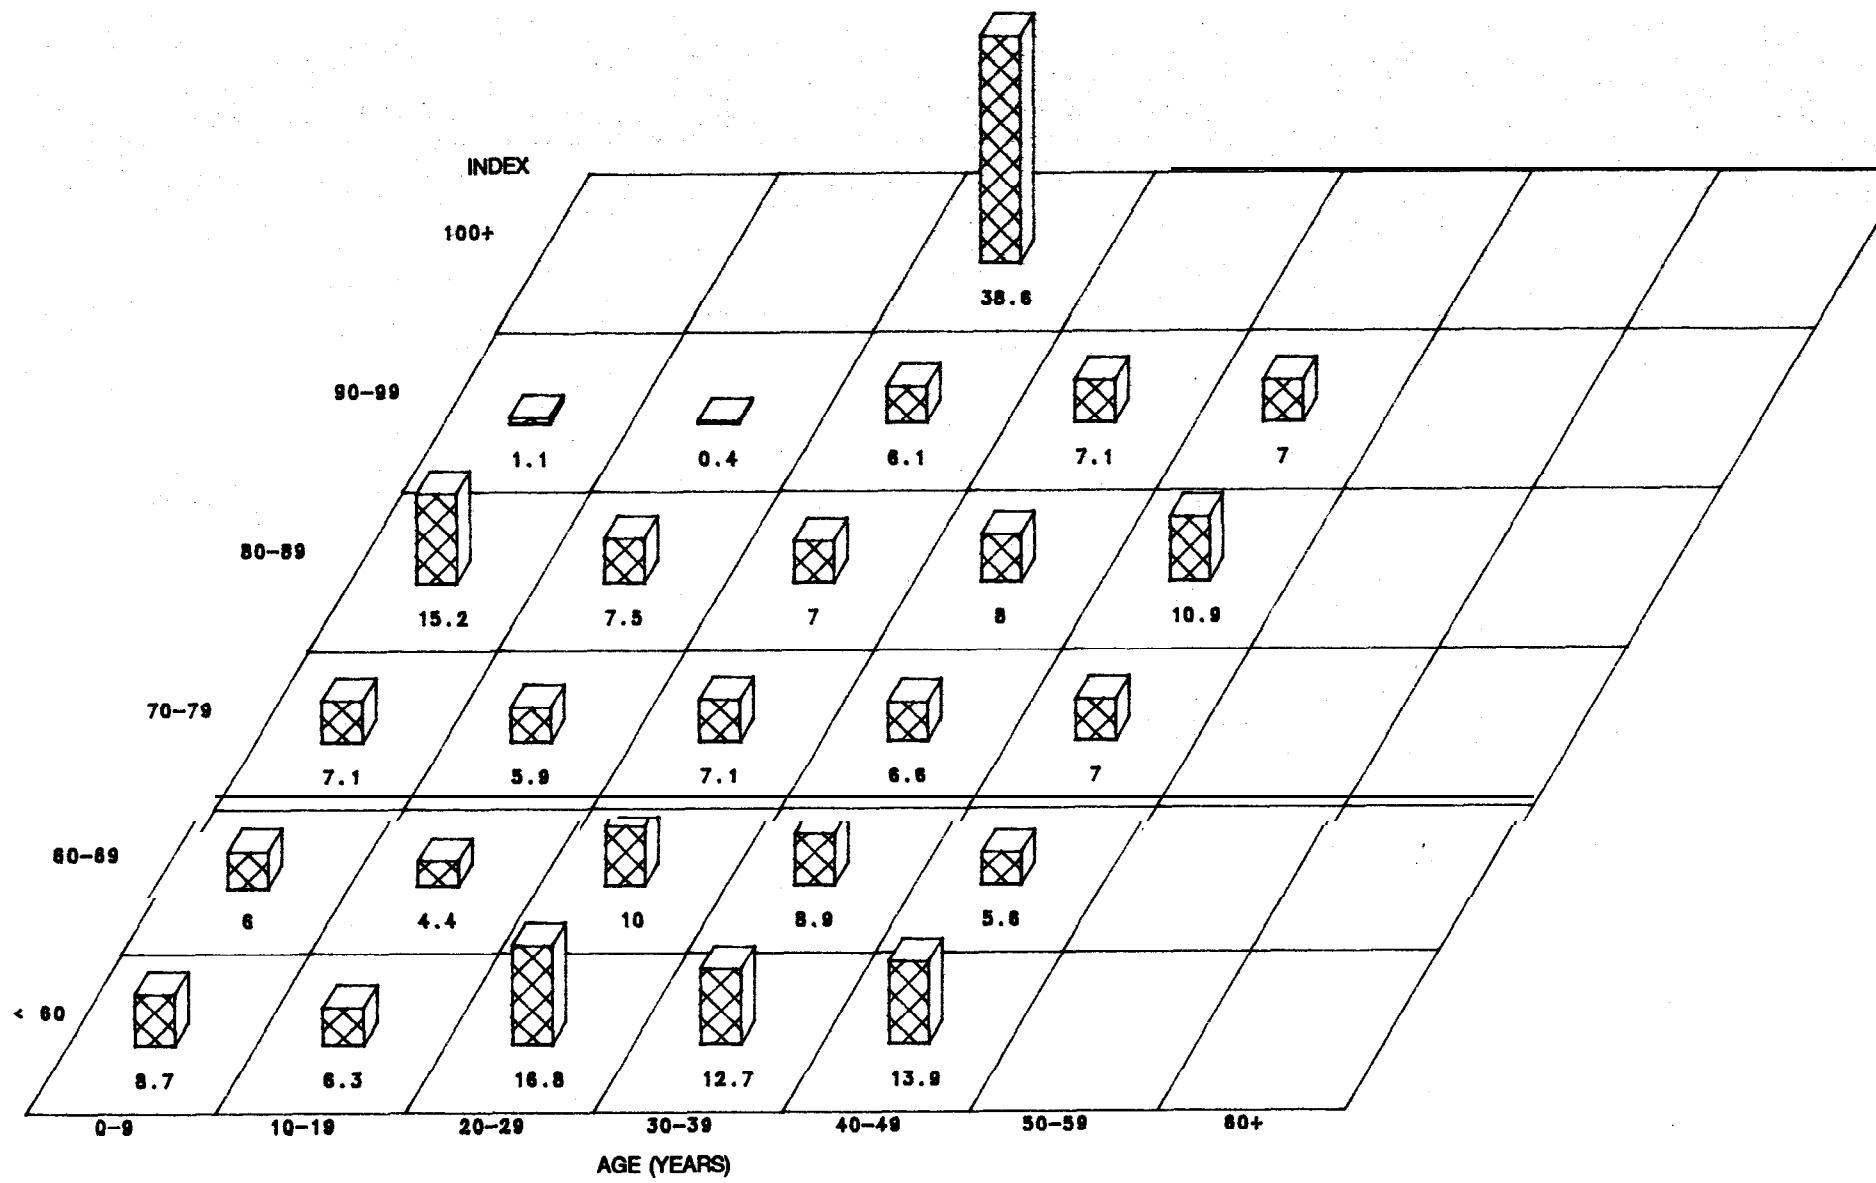

Figure 13C.—Percentage of basal area per acre of **non-yellow-pine** species, by site index and stand age, for planted slash pine stands in the Southeast.
(Represents 5,956,523 acres. Georgia site index data treated as missing values.)

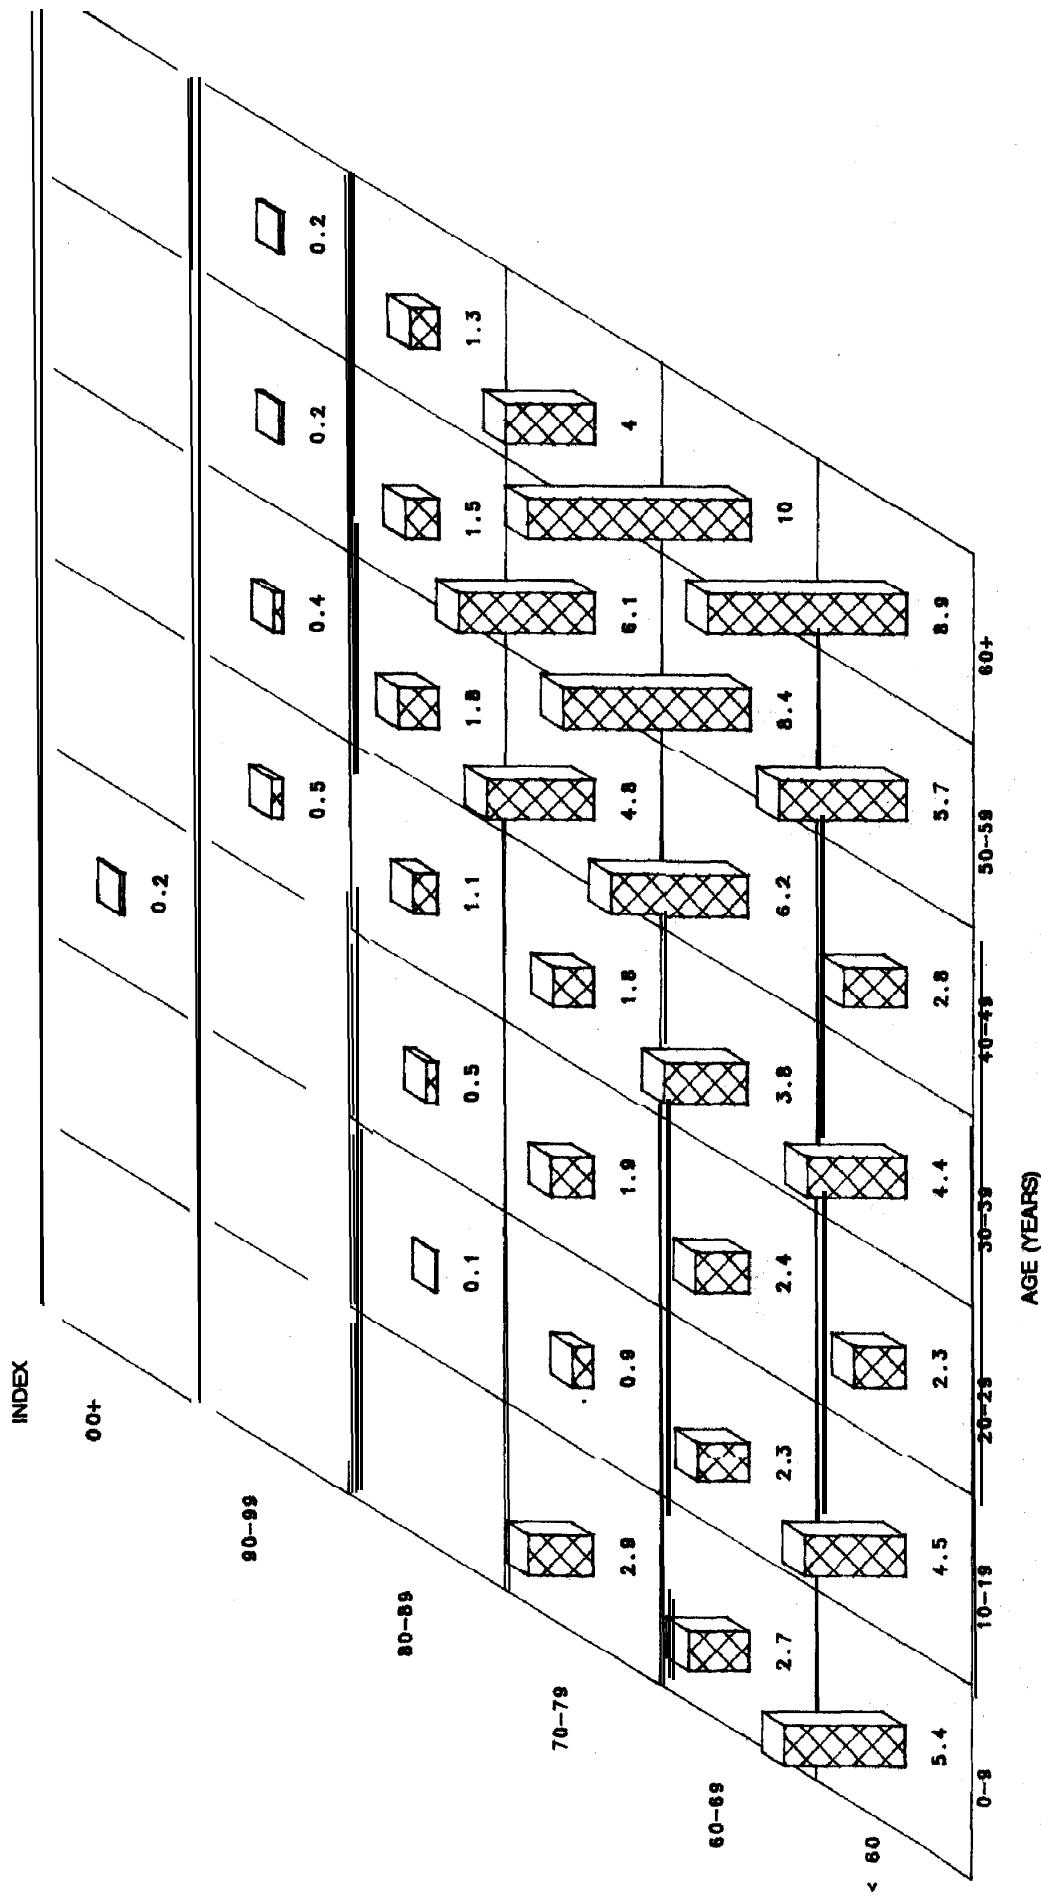

Figure 14A.—Percentage distribution of longleaf pine stands in the Southeast, by site index and stand age. (Represents 2,229,279 acres of natural stands and 183,595 acres of planted stands. Georgia site index data treated as missing values.)

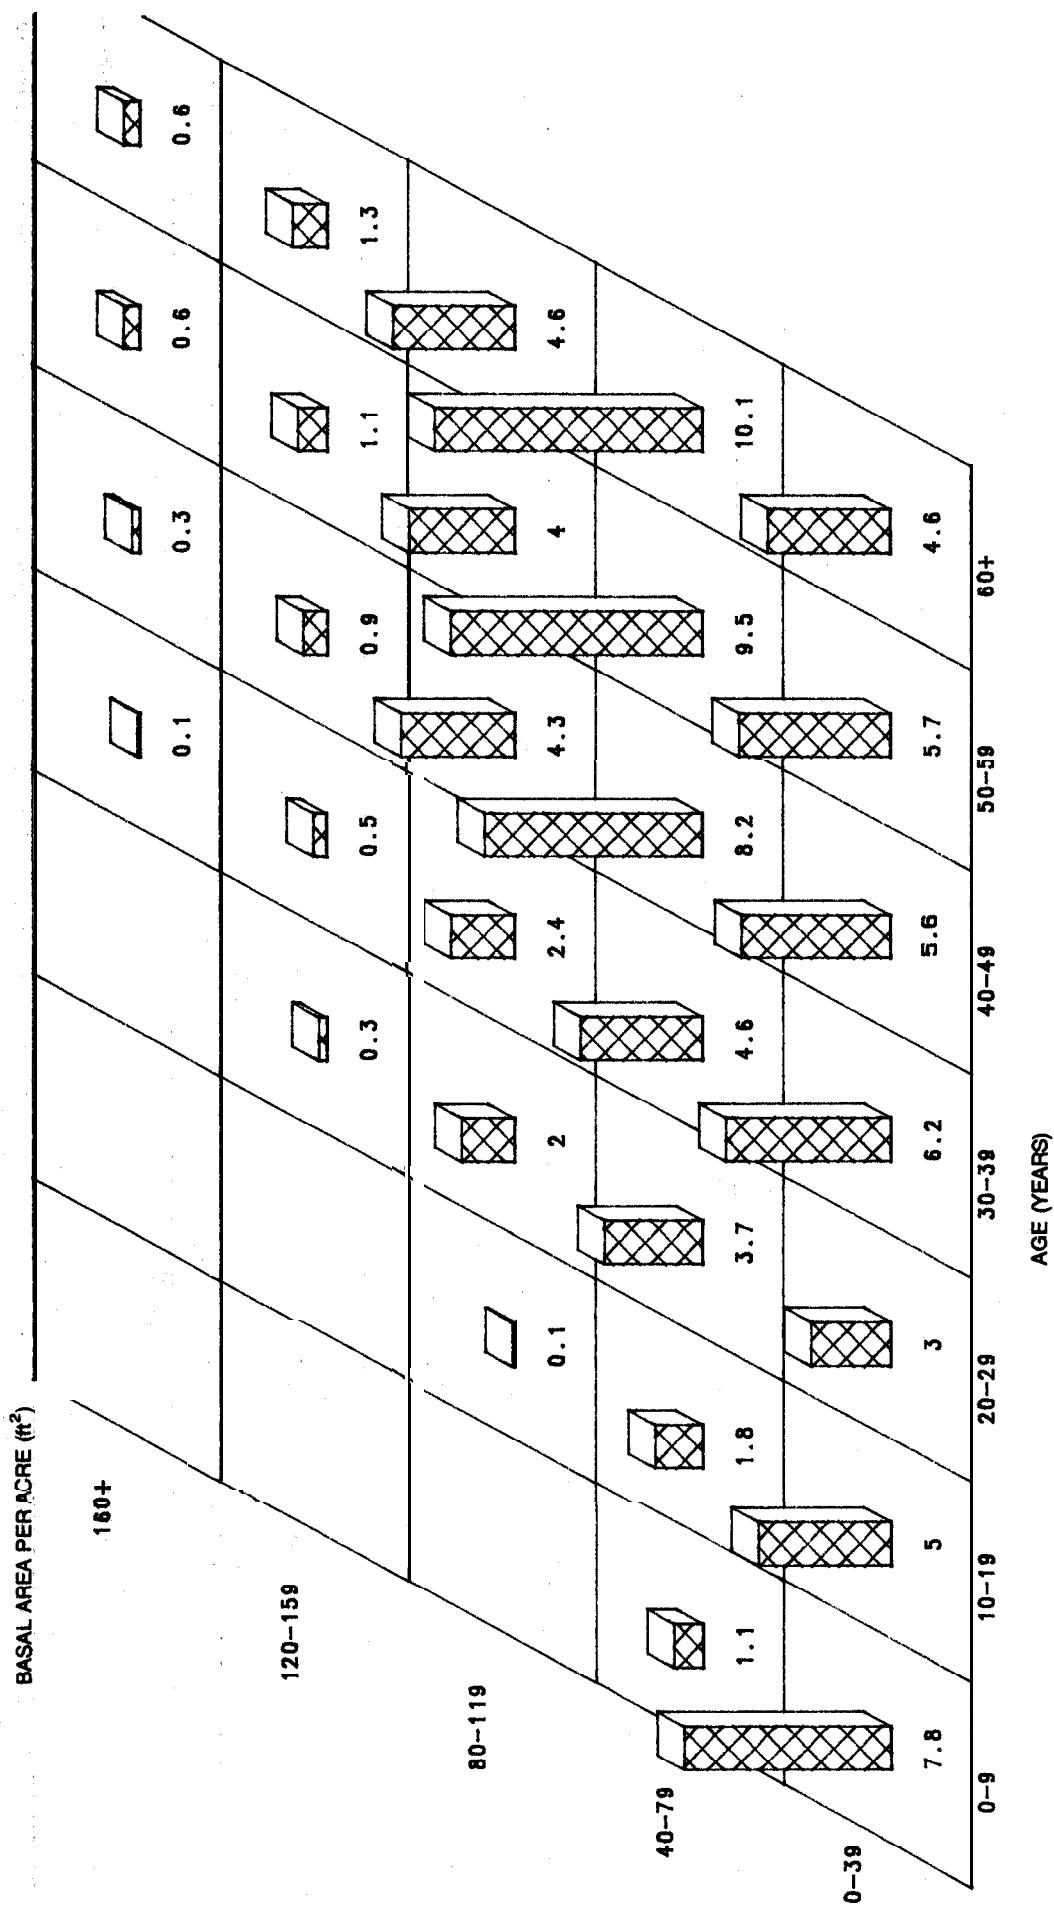

Figure 14B.—Percentage distribution of longleaf pine stands in the Southeast, by basal area per acre and stand age. (Represents 2,229,279 acres of natural stands, and 183,595 acres of planted stands.)

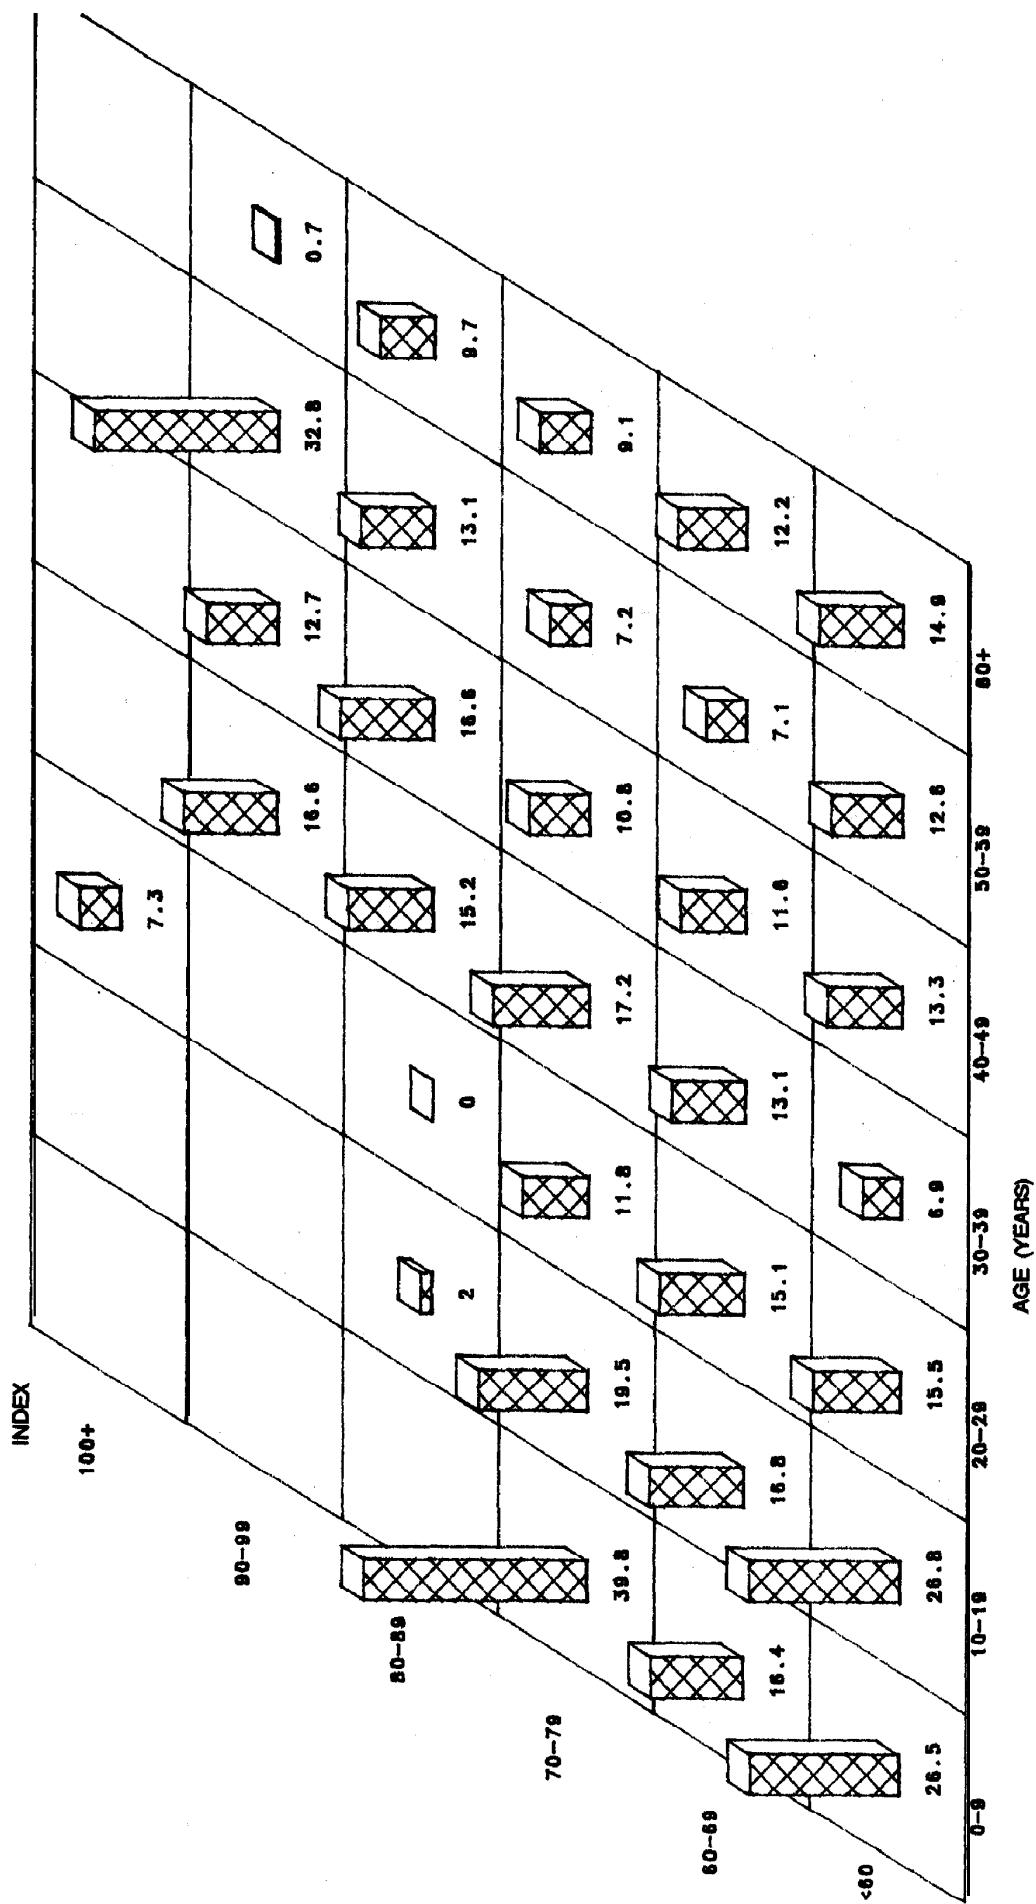

Figure 14C.—Percentage of basal area per acre of non-yellow-pine species, by site index and stand age, for longleaf pine stands in the Southeast.
(Represents 2,229,279 acres of natural, and 183,595 acres of planted stands. Georgia site index data treated as missing values.)

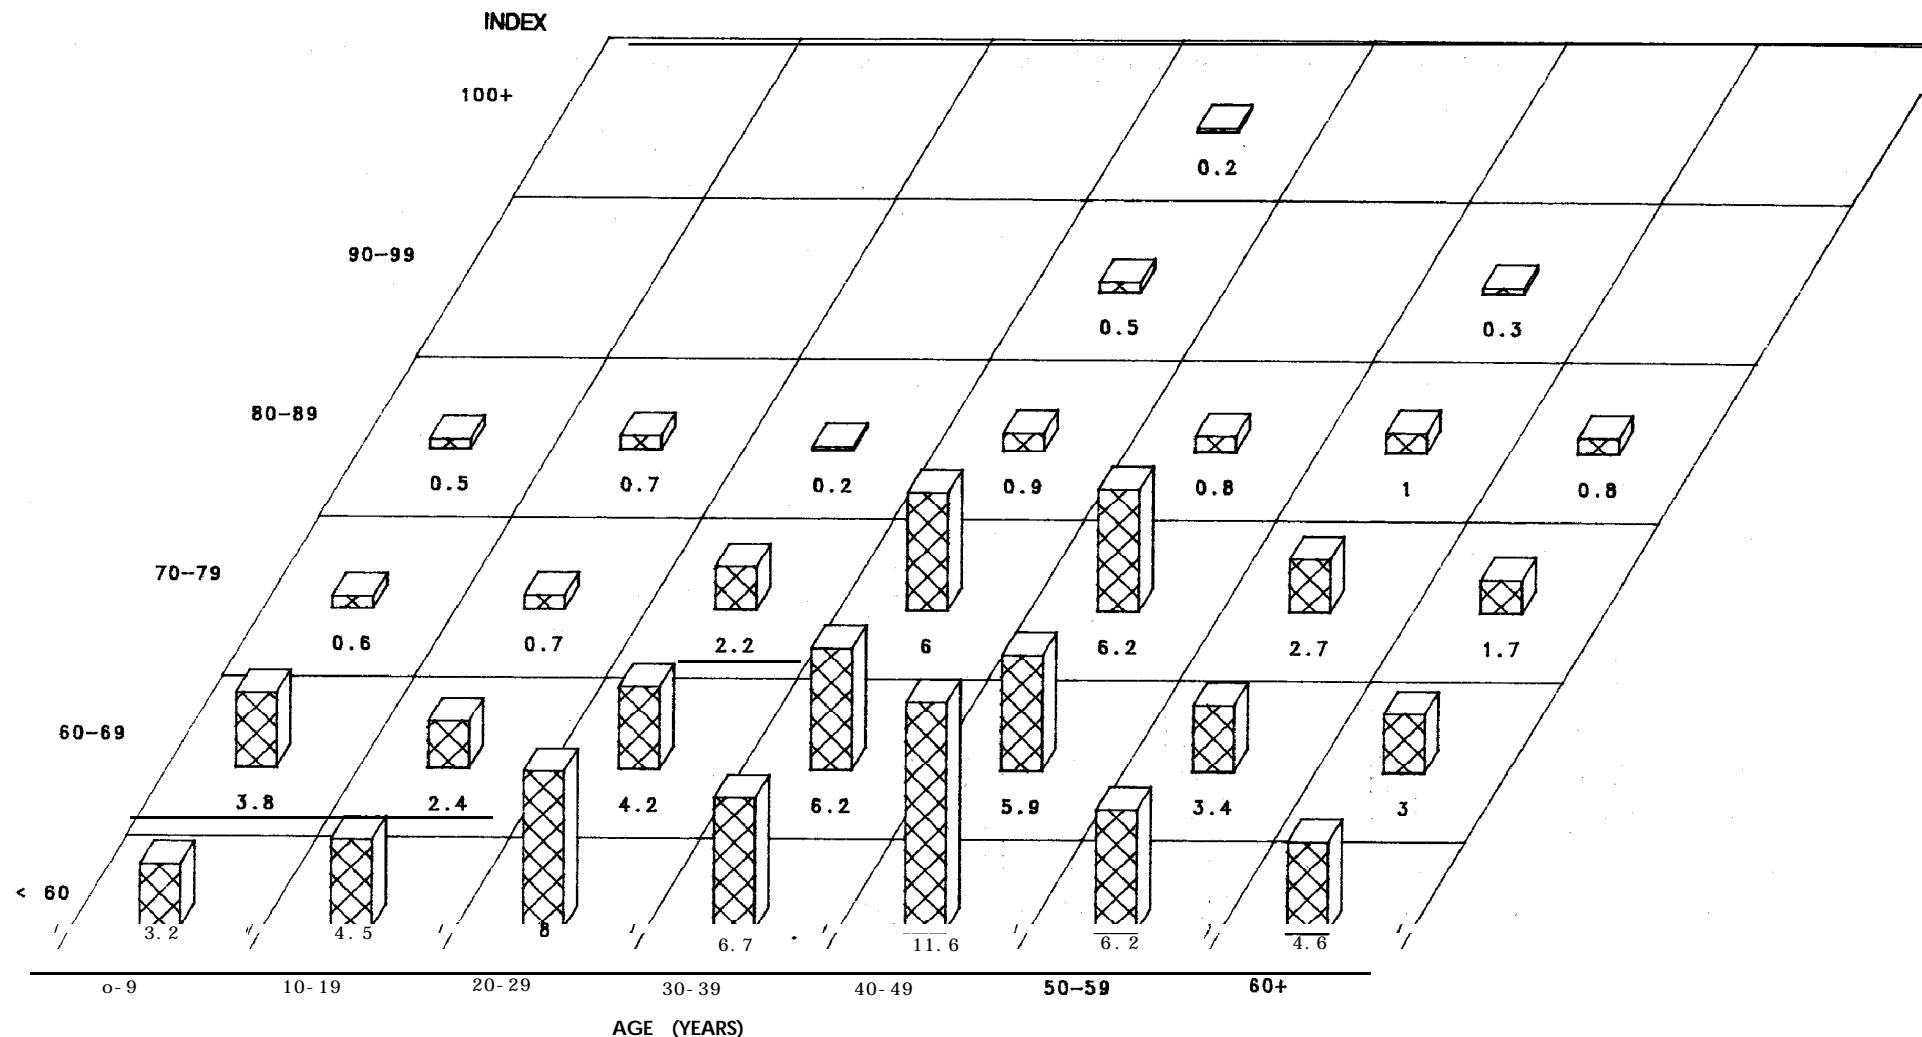

Figure 15A.—Percentage distribution of pond pine stands in the Southeast, by site index and stand age. (Represents 1,237,175 acres of natural stands, and 11,045 acres of planted stands. Georgia site index data treated as missing values.)

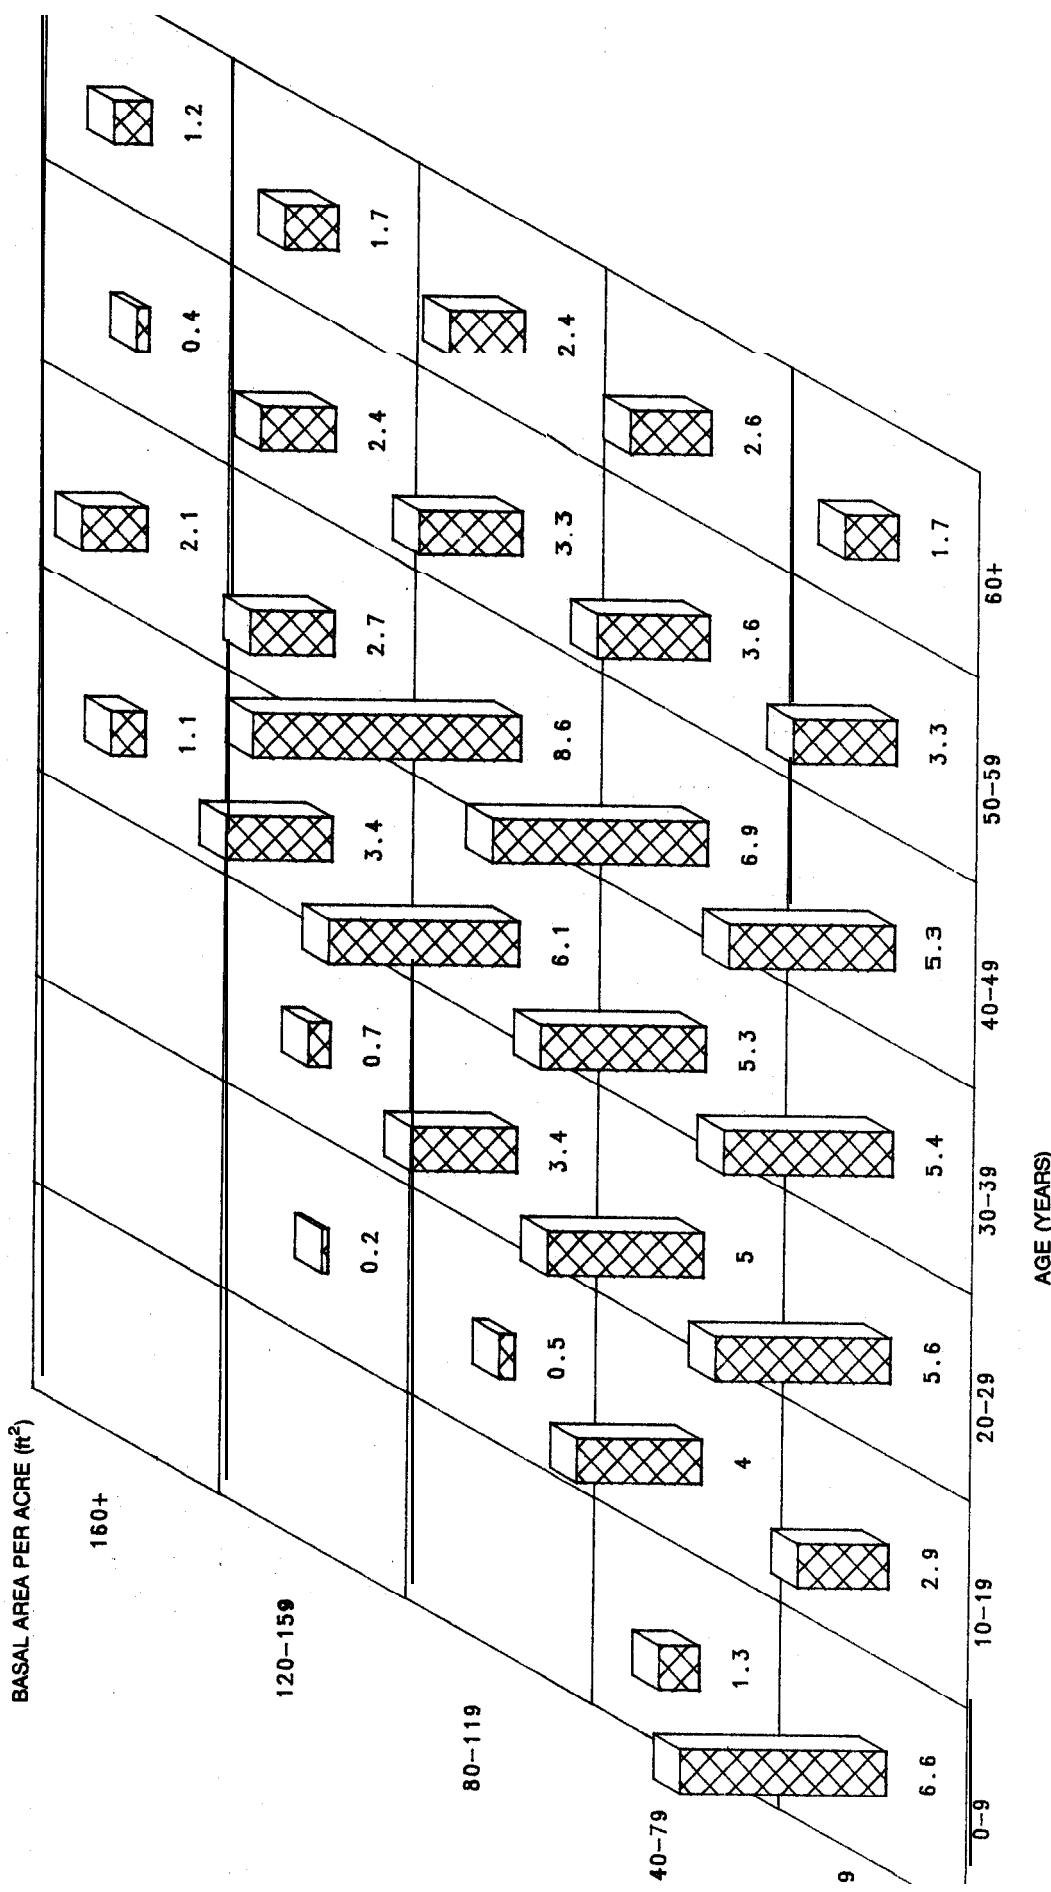

Figure 15B.—Percentage distribution of pond pine stands in the Southeast, by basal area per acre and stand age. (Represents 1,237,175 acres of natural stands, and 11,046 acres of planted stands.)

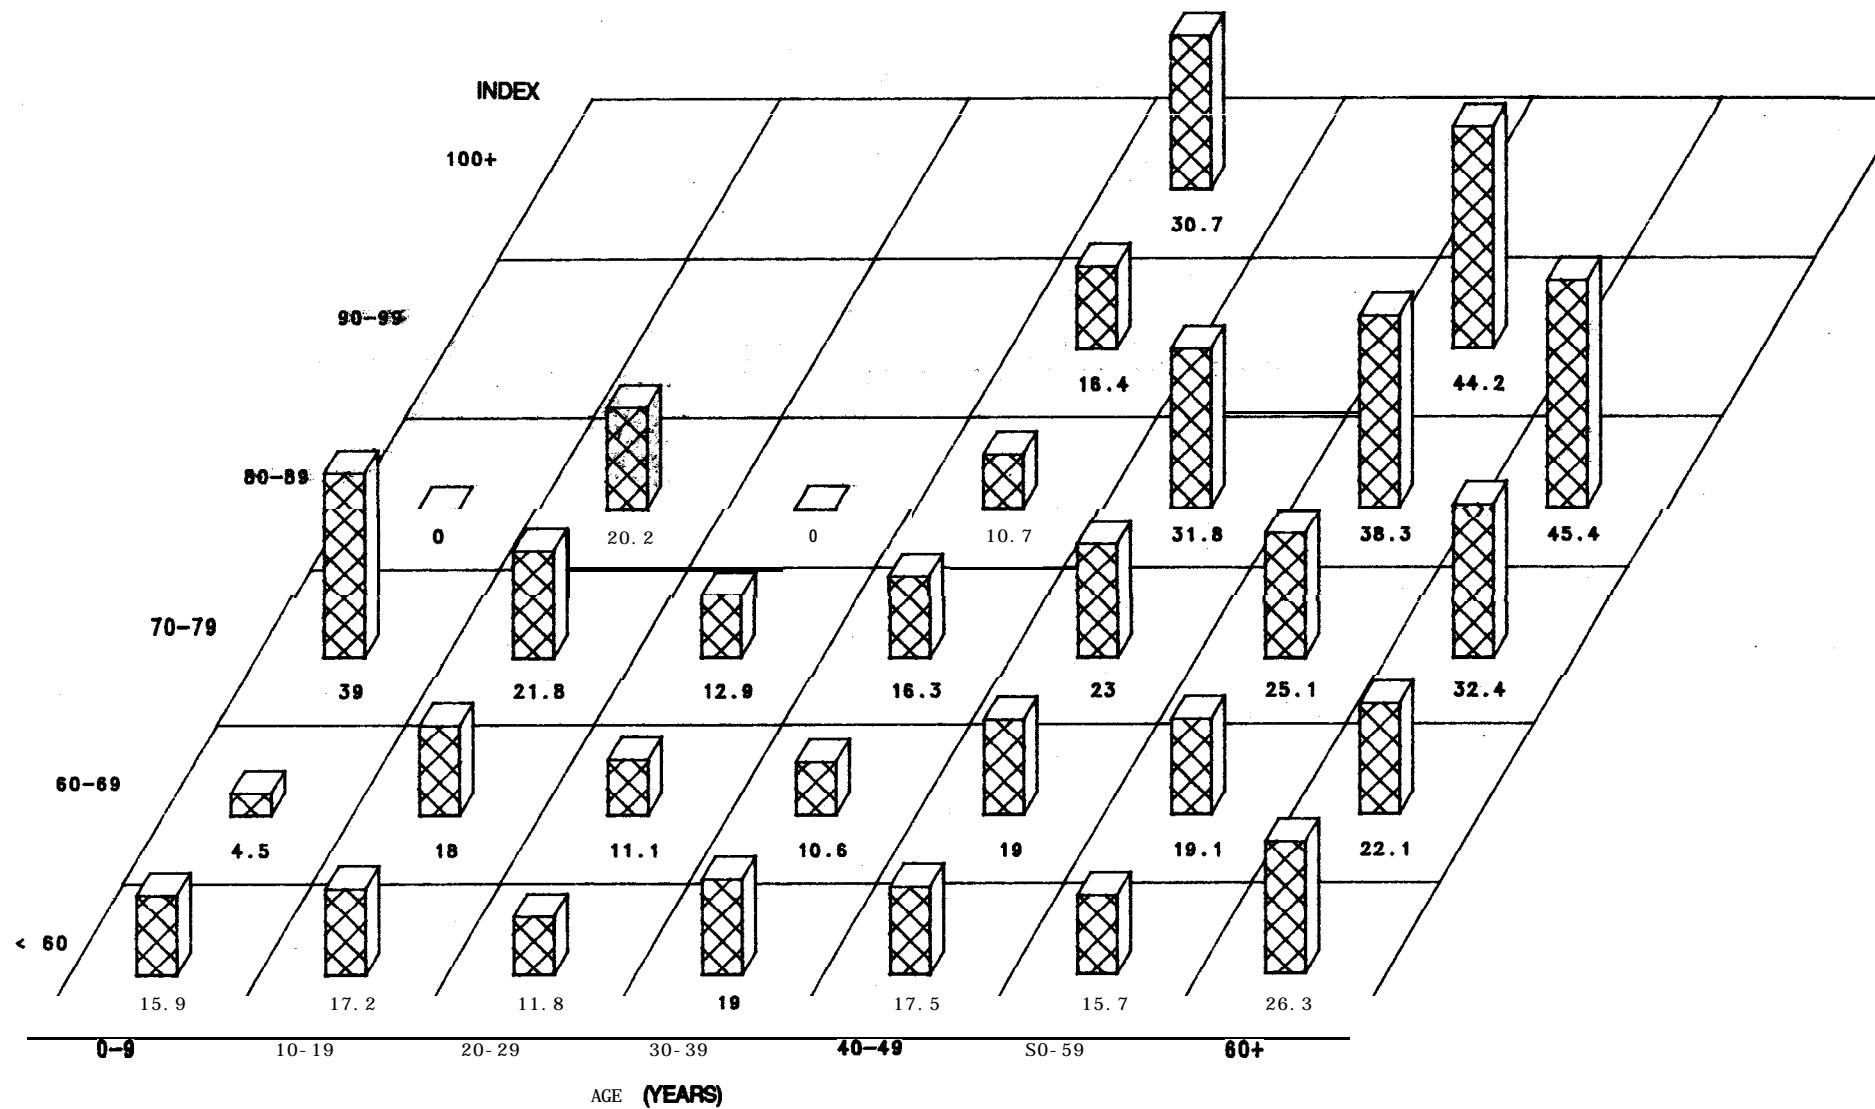

Figure 15C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for pond pine in the Southeast.
(Represents 1,237,175 acres of natural stands, and 11,046 acres of planted stands. Georgia site index data treated as missing values.)

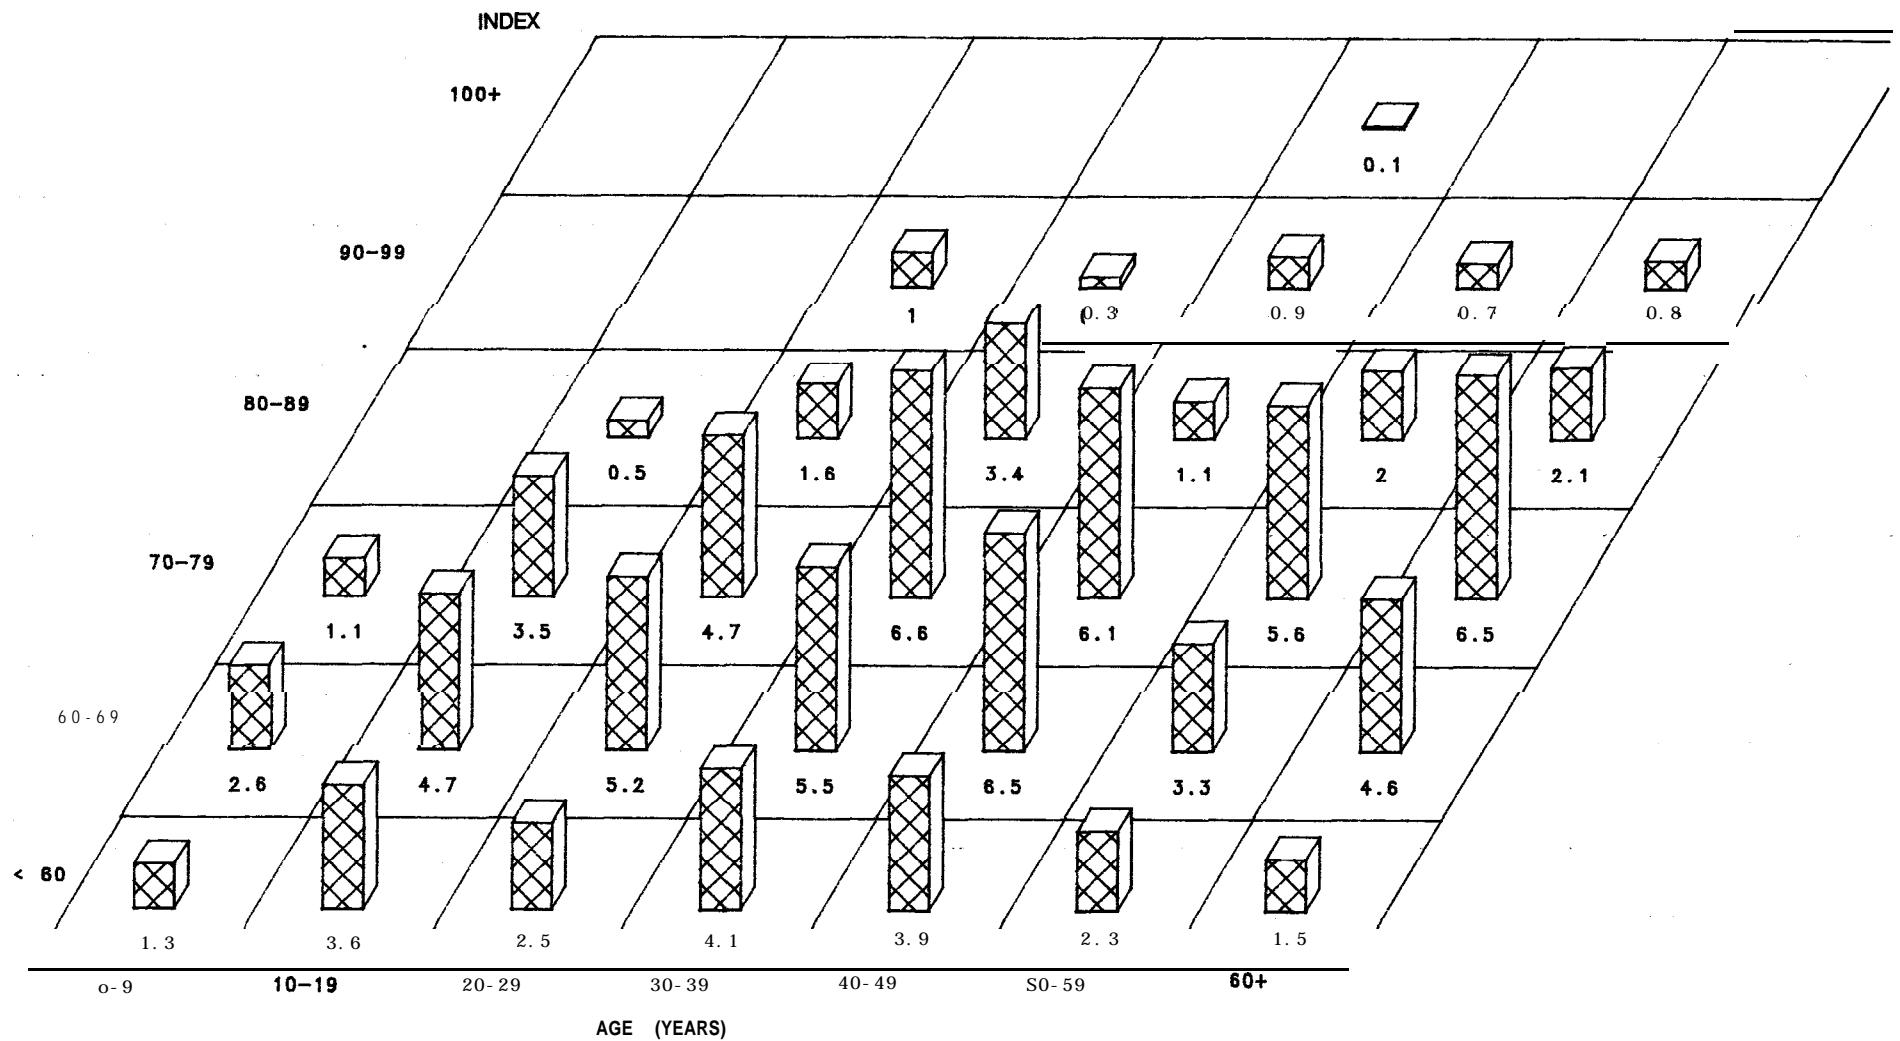

Figure 16A.—Percentage distribution of shortleaf pine stands in the Southeast, by site index and stand age. (Represents 1,941,495 acres of natural stands, and 19,991 acres of planted stands. Georgia site index data treated as missing values.)

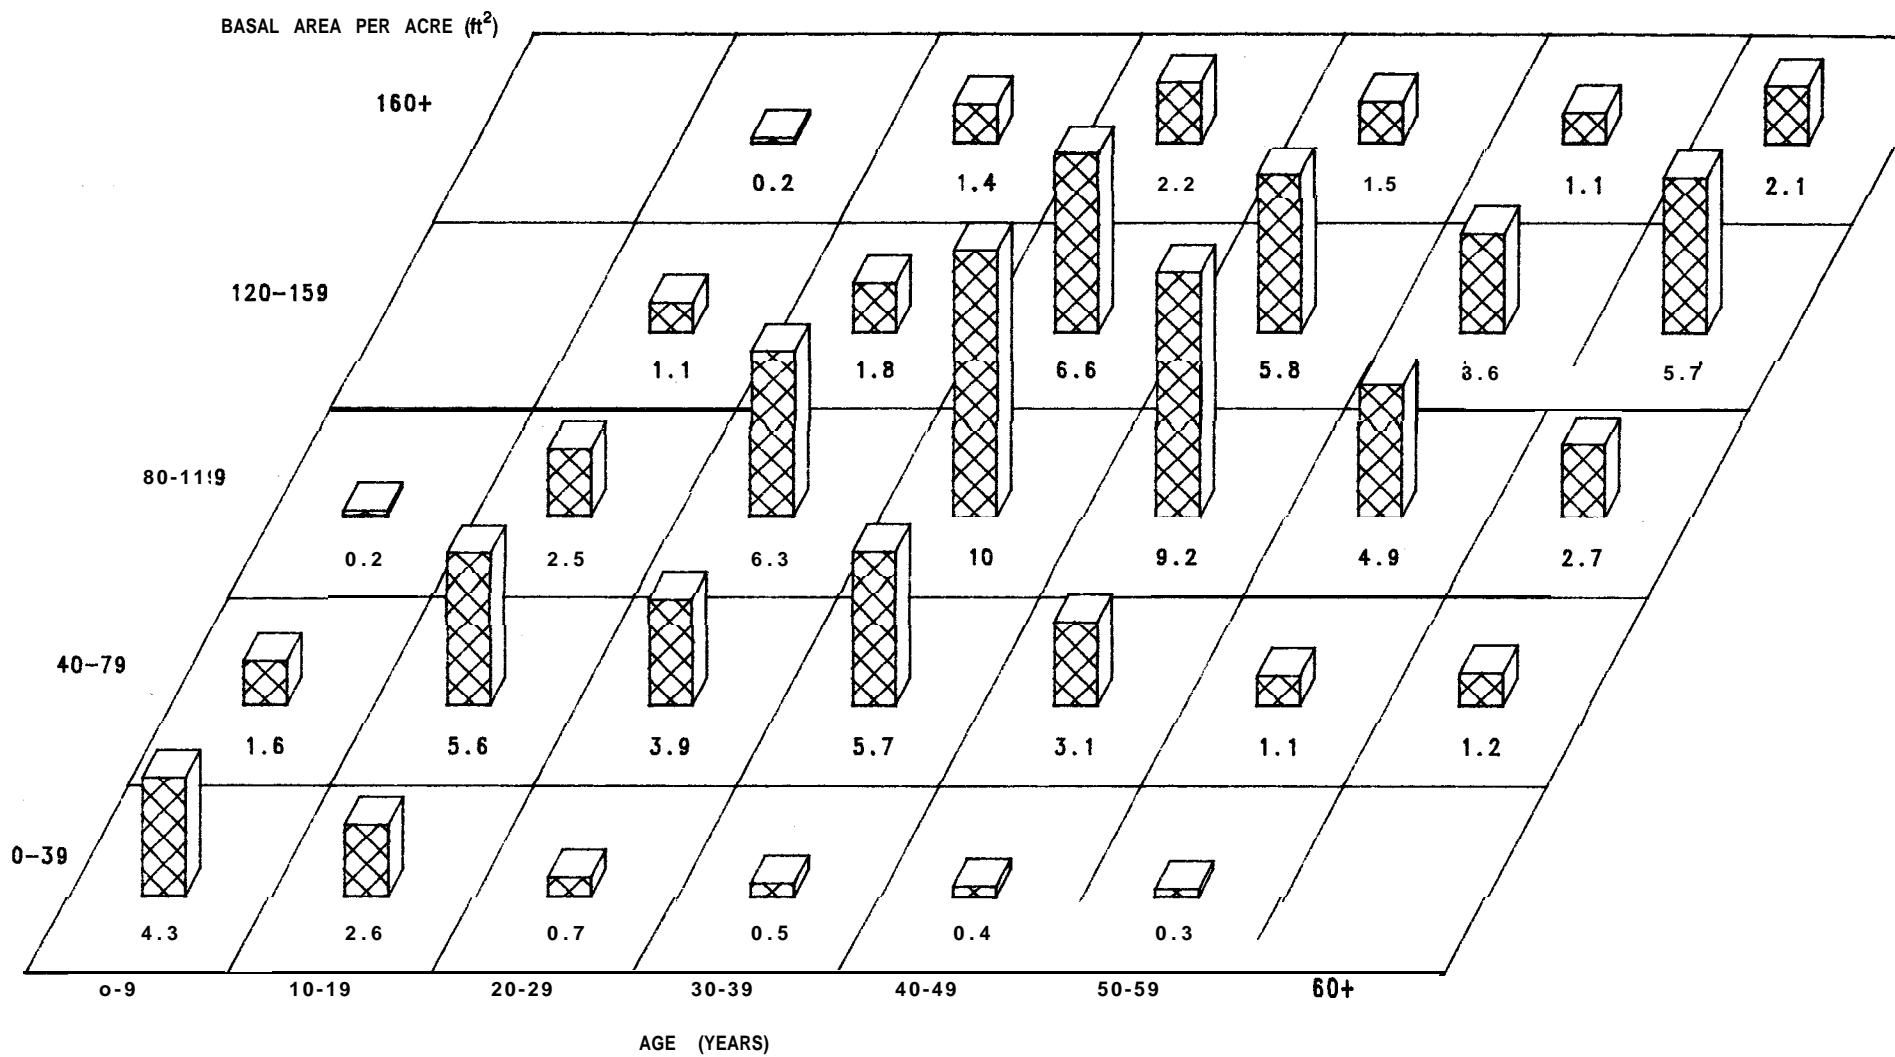

Figure 16B.—Percentage distribution of shortleaf pine stands in the Southeast, by basal area per acre and stand age. (Represents 1,941,495 acres of natural stands, and 19,981 of planted stands.)

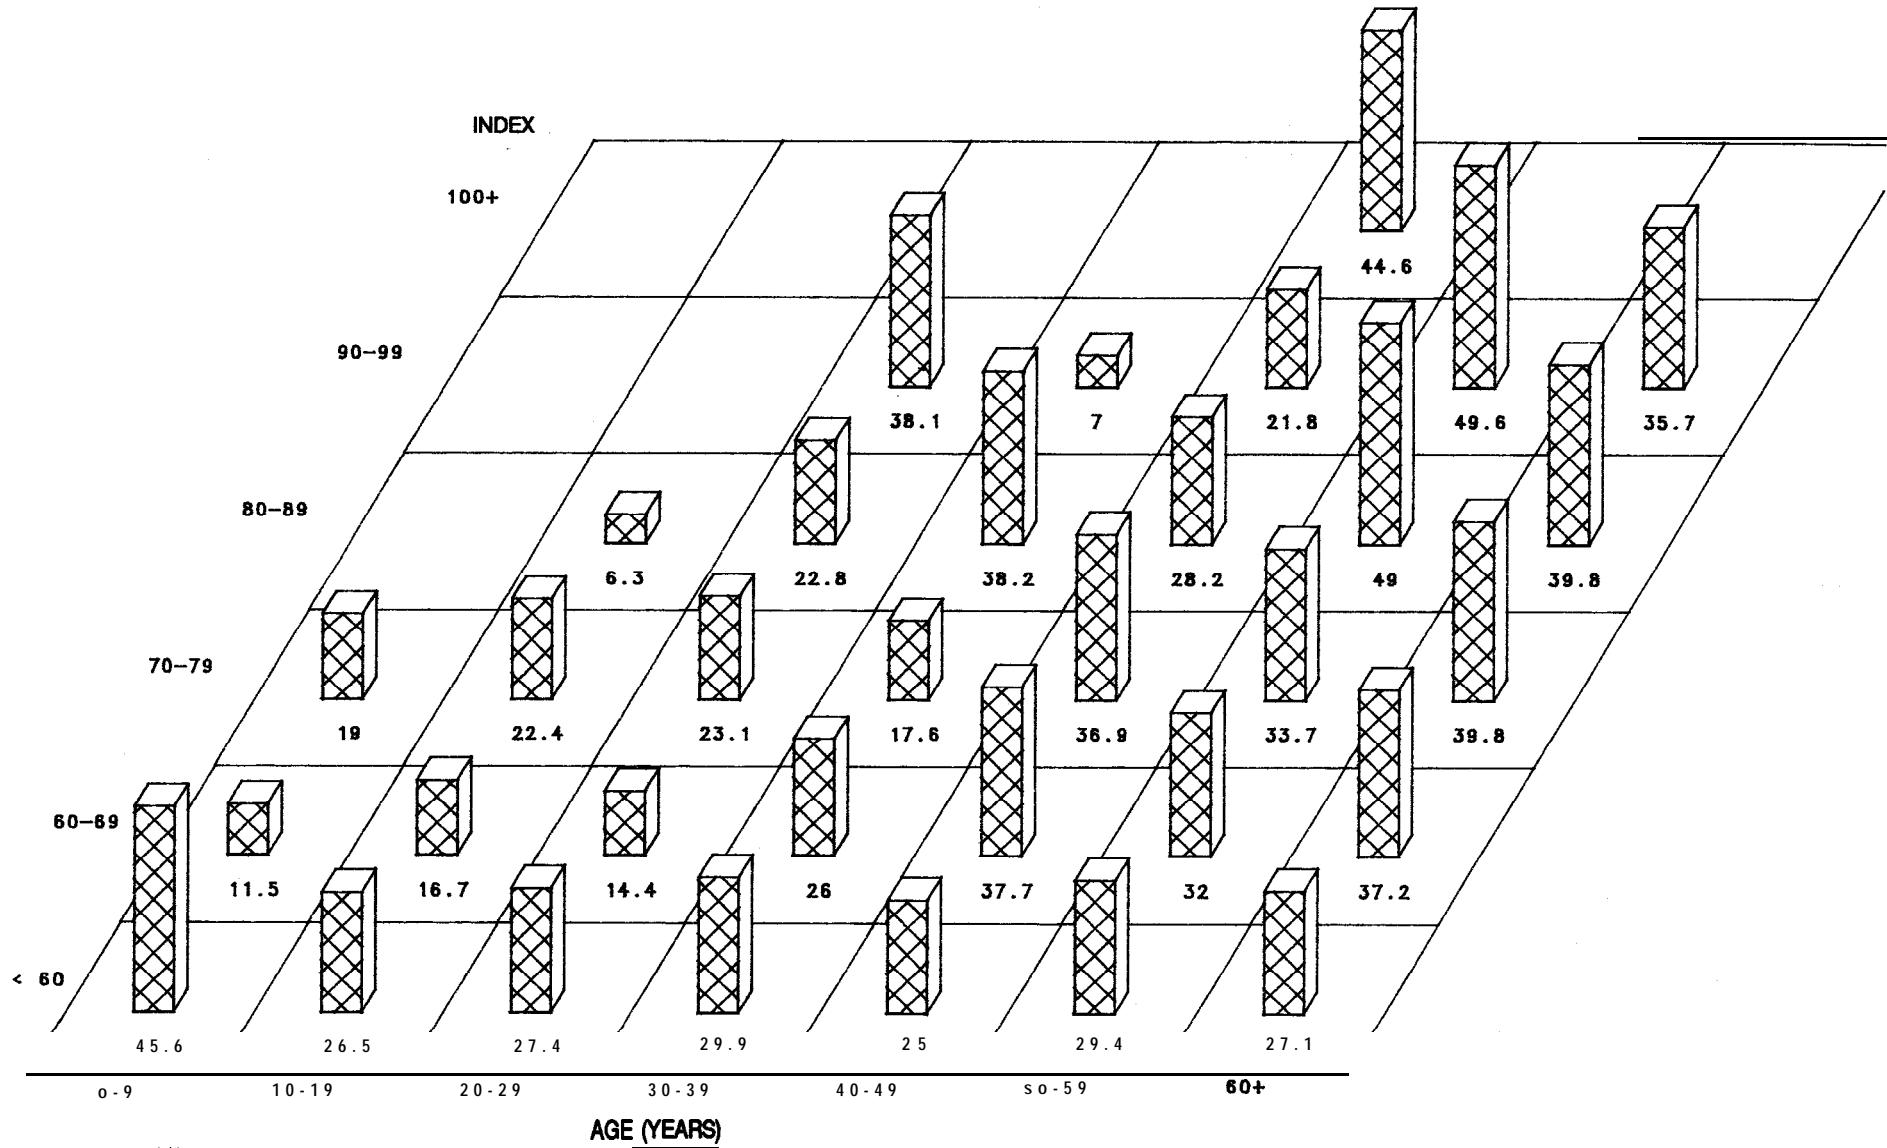

Figure 16C.—Percentage of basal area in non-yellowpine species, by site index and stand age; for **shortleaf** pine stands in the Southeast
(Represents 1,941,495 acres of natural stands, and 19,981 acres of planted stands. Georgia site index data treated as missing values.)

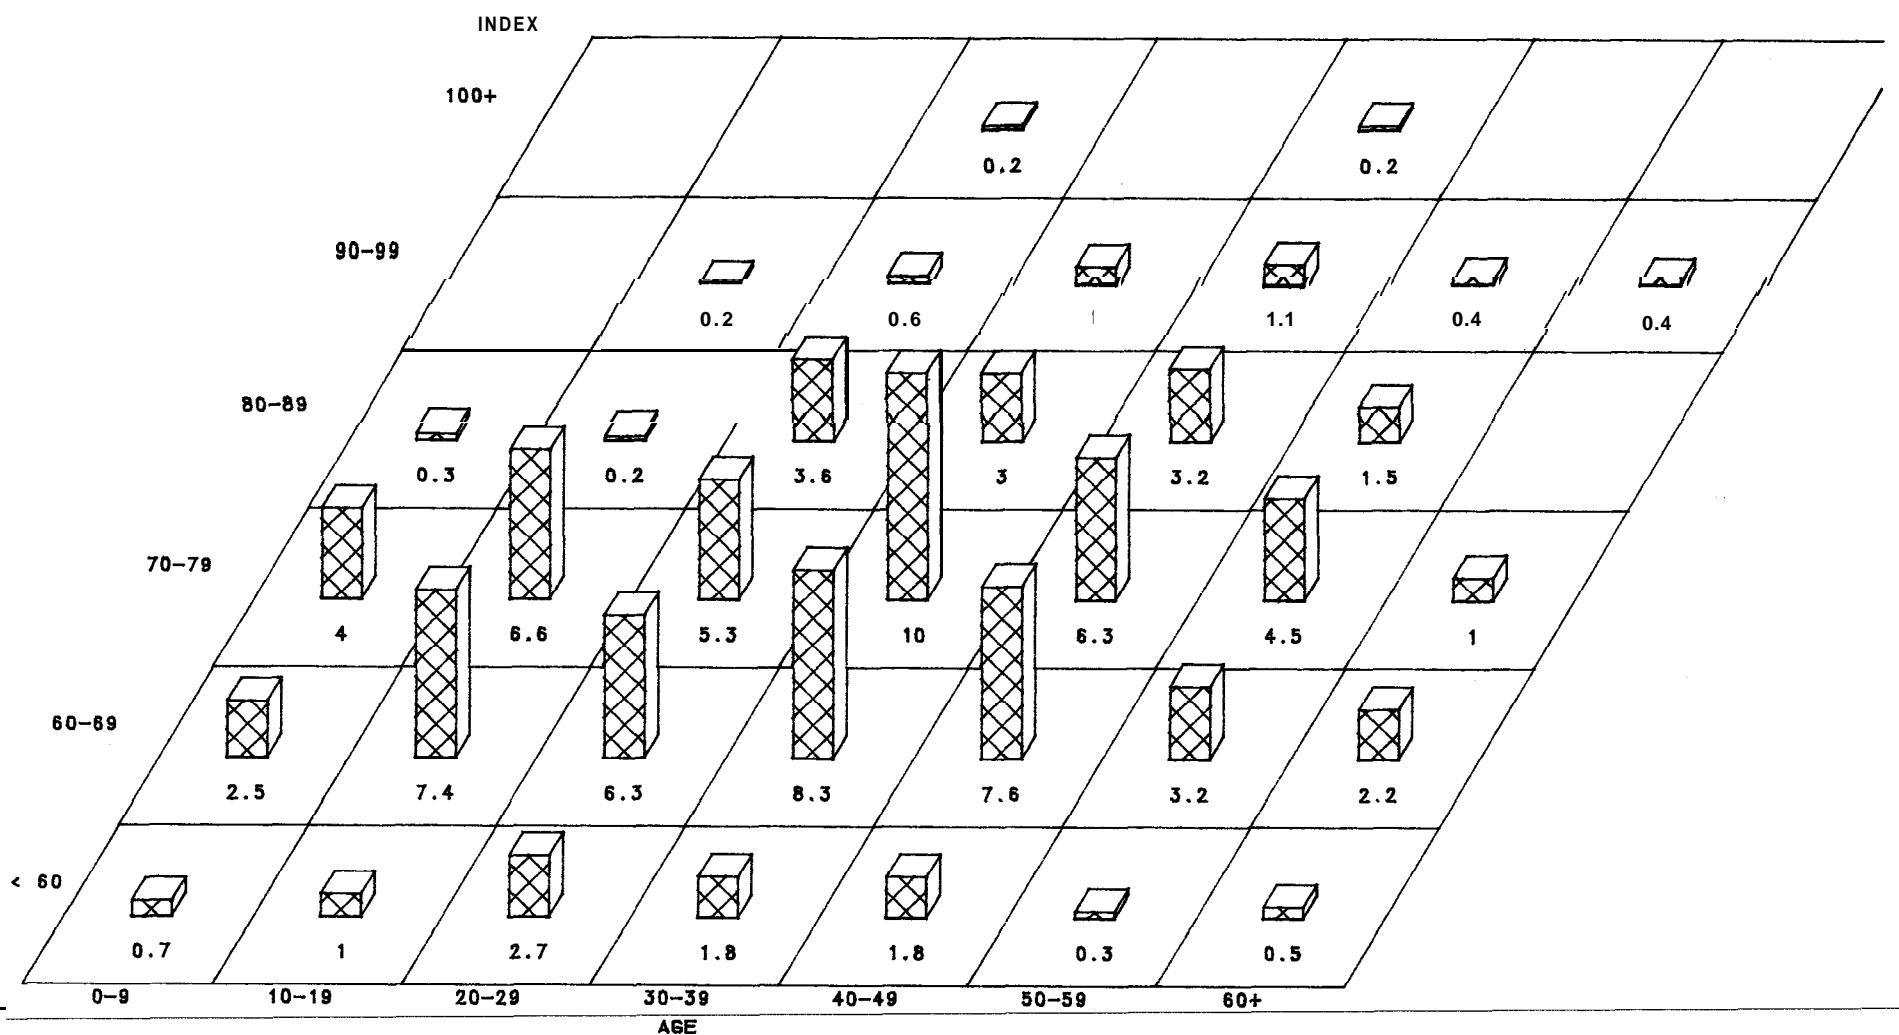

Figure 17A.—Percentage distribution of Virginia pine stands in the **Southeast**, by site index and stand age. (Represents 2,329,237 acres of **natural** stands, and 52,738 acres of planted stands. Georgia site index data treated as missing values.)

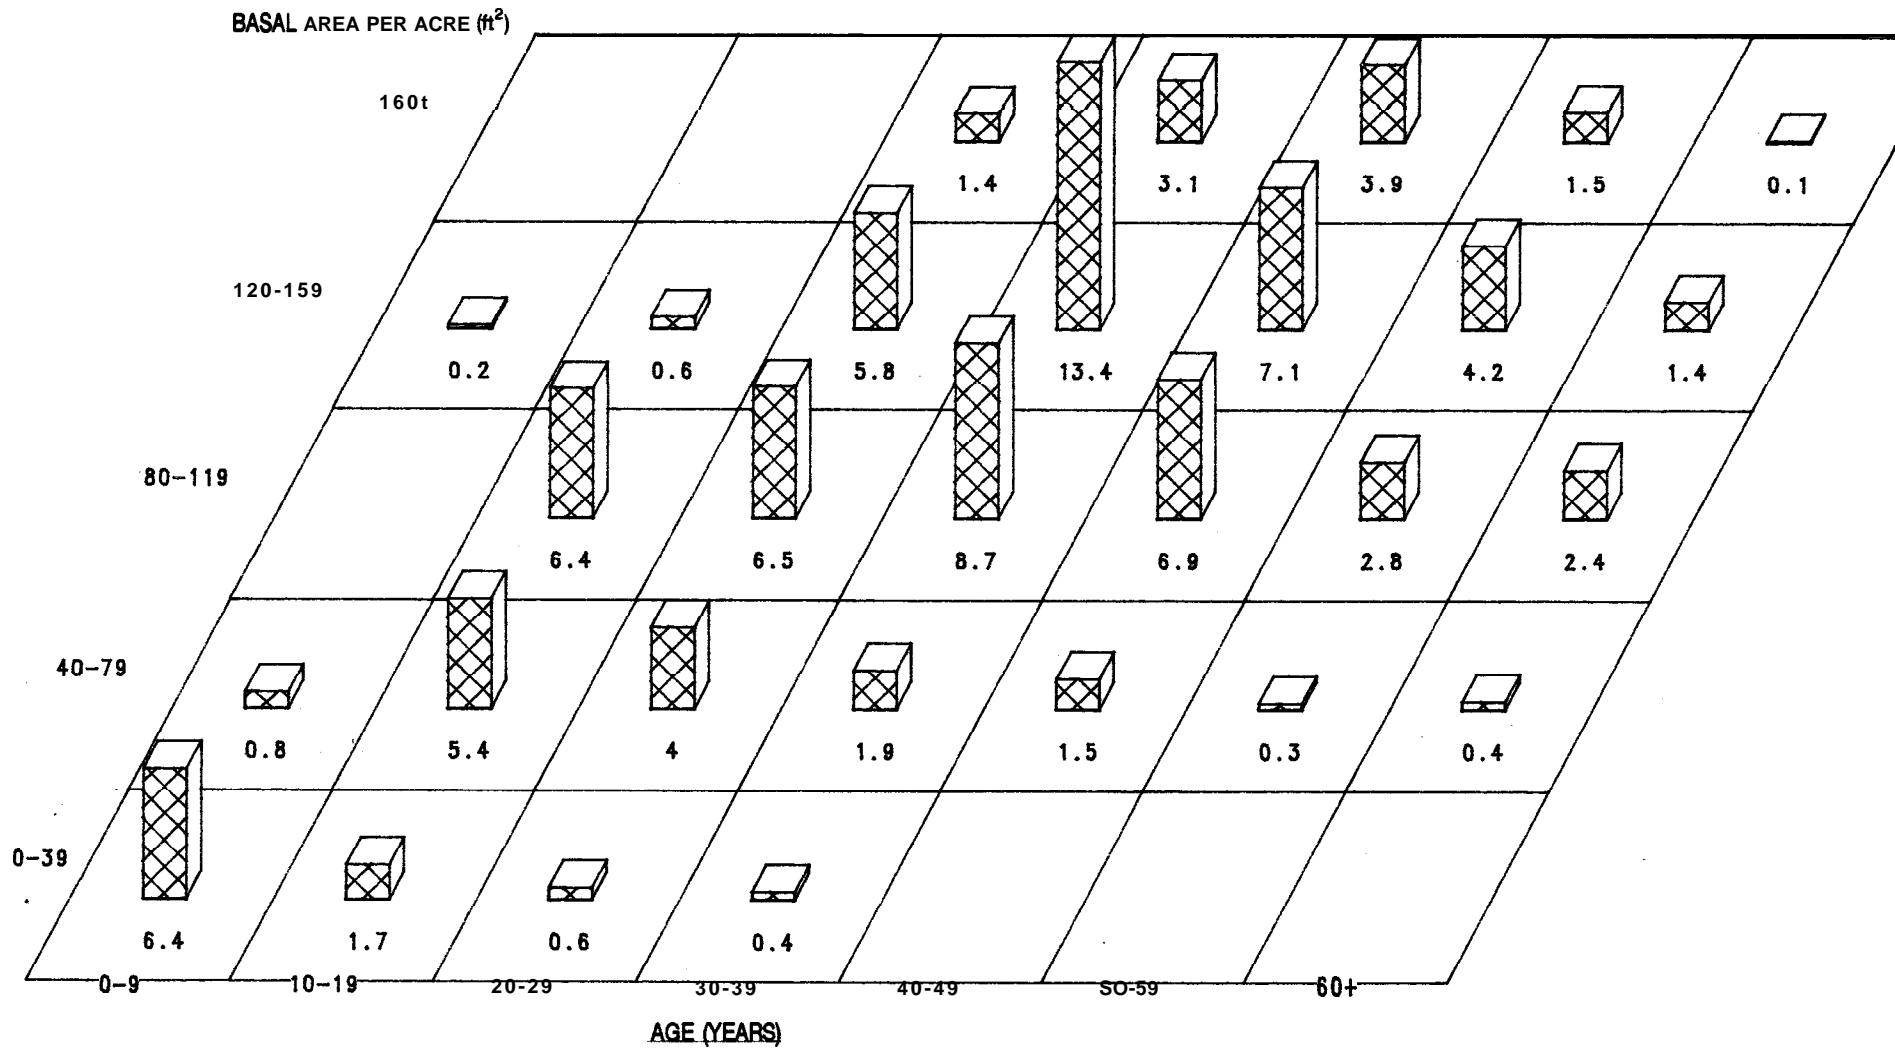

Figure 17B.—Percentage distribution of Virginia pine stands in the Southeast, by basal area per acre and stand age. (Represents 2,329,237 acres of natural stands, and 52,736 acres of planted stands.)

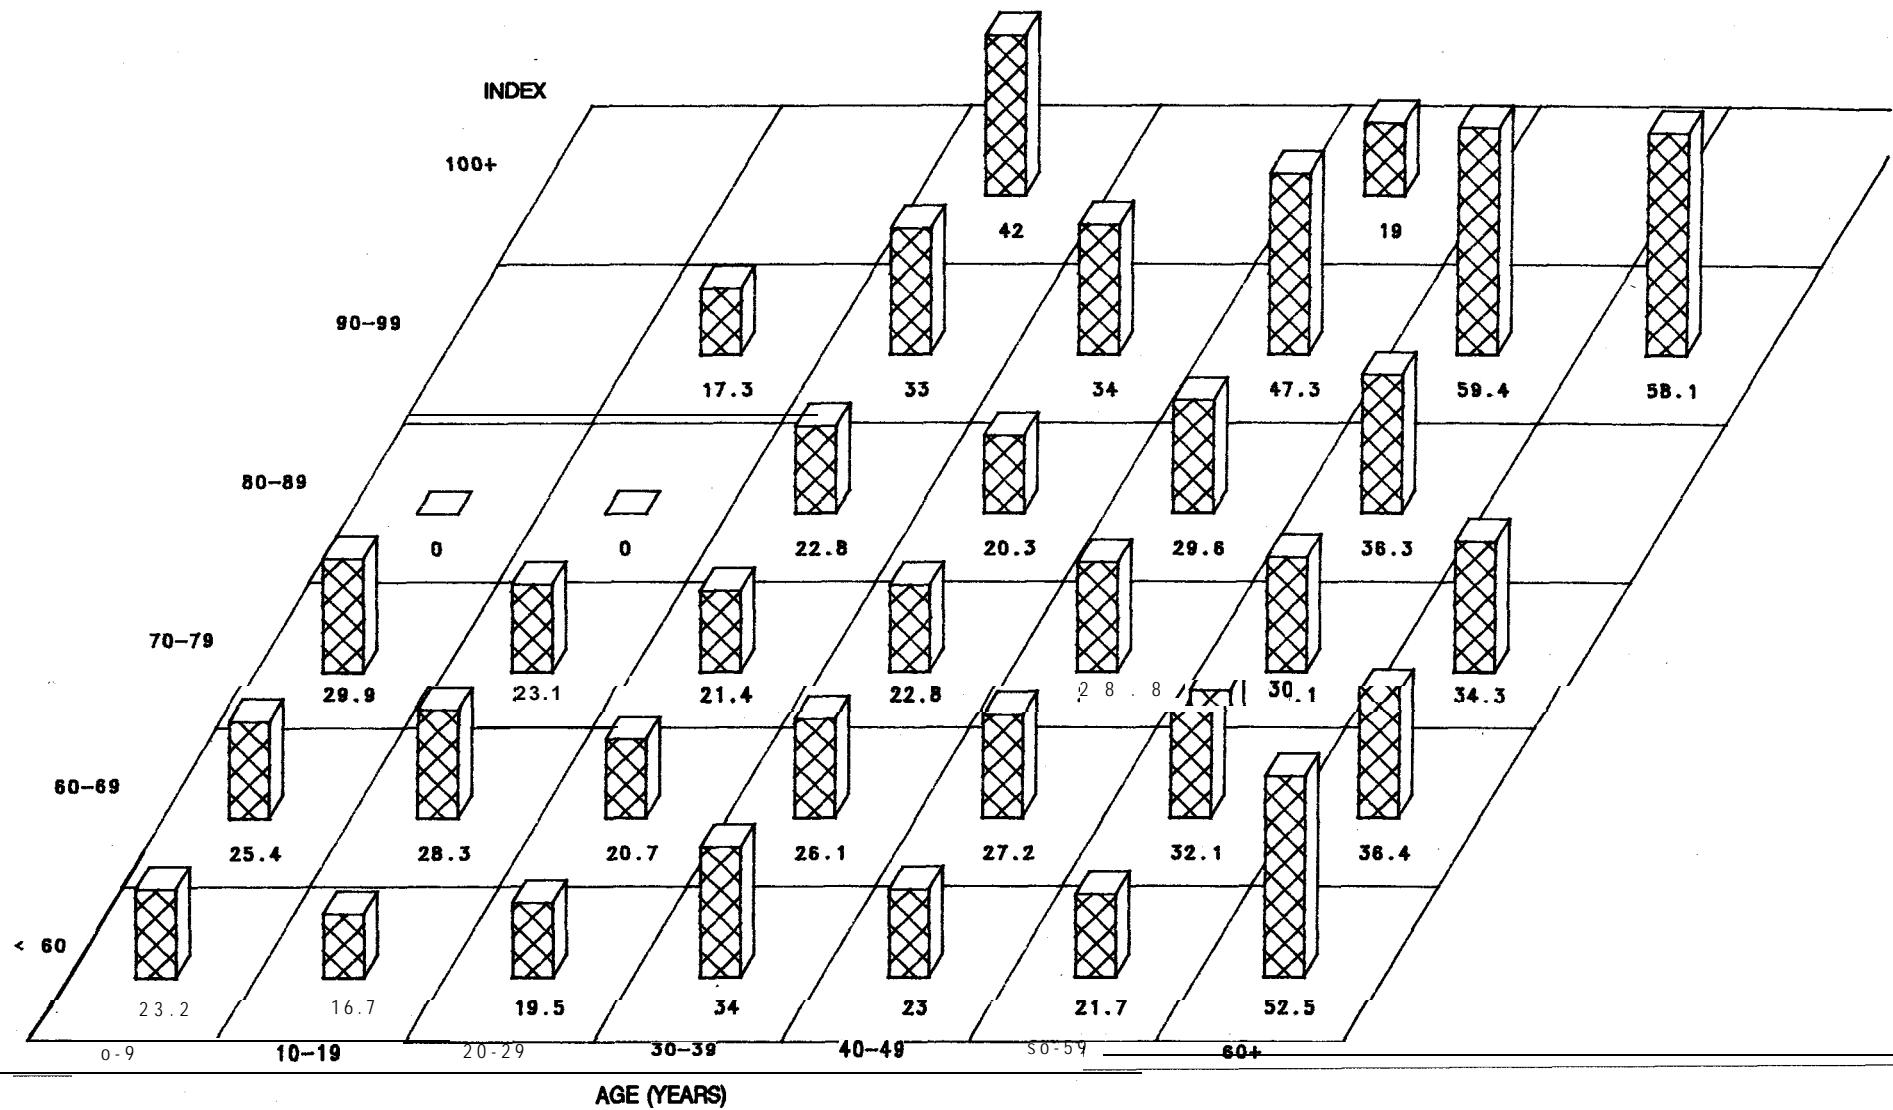

Figure 17C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for Virginia pine stands in the Southeast
(Represents 2,329,237 acres of natural stands, and 52,738 acres of planted stands. Georgia site index data treated as missing values.)

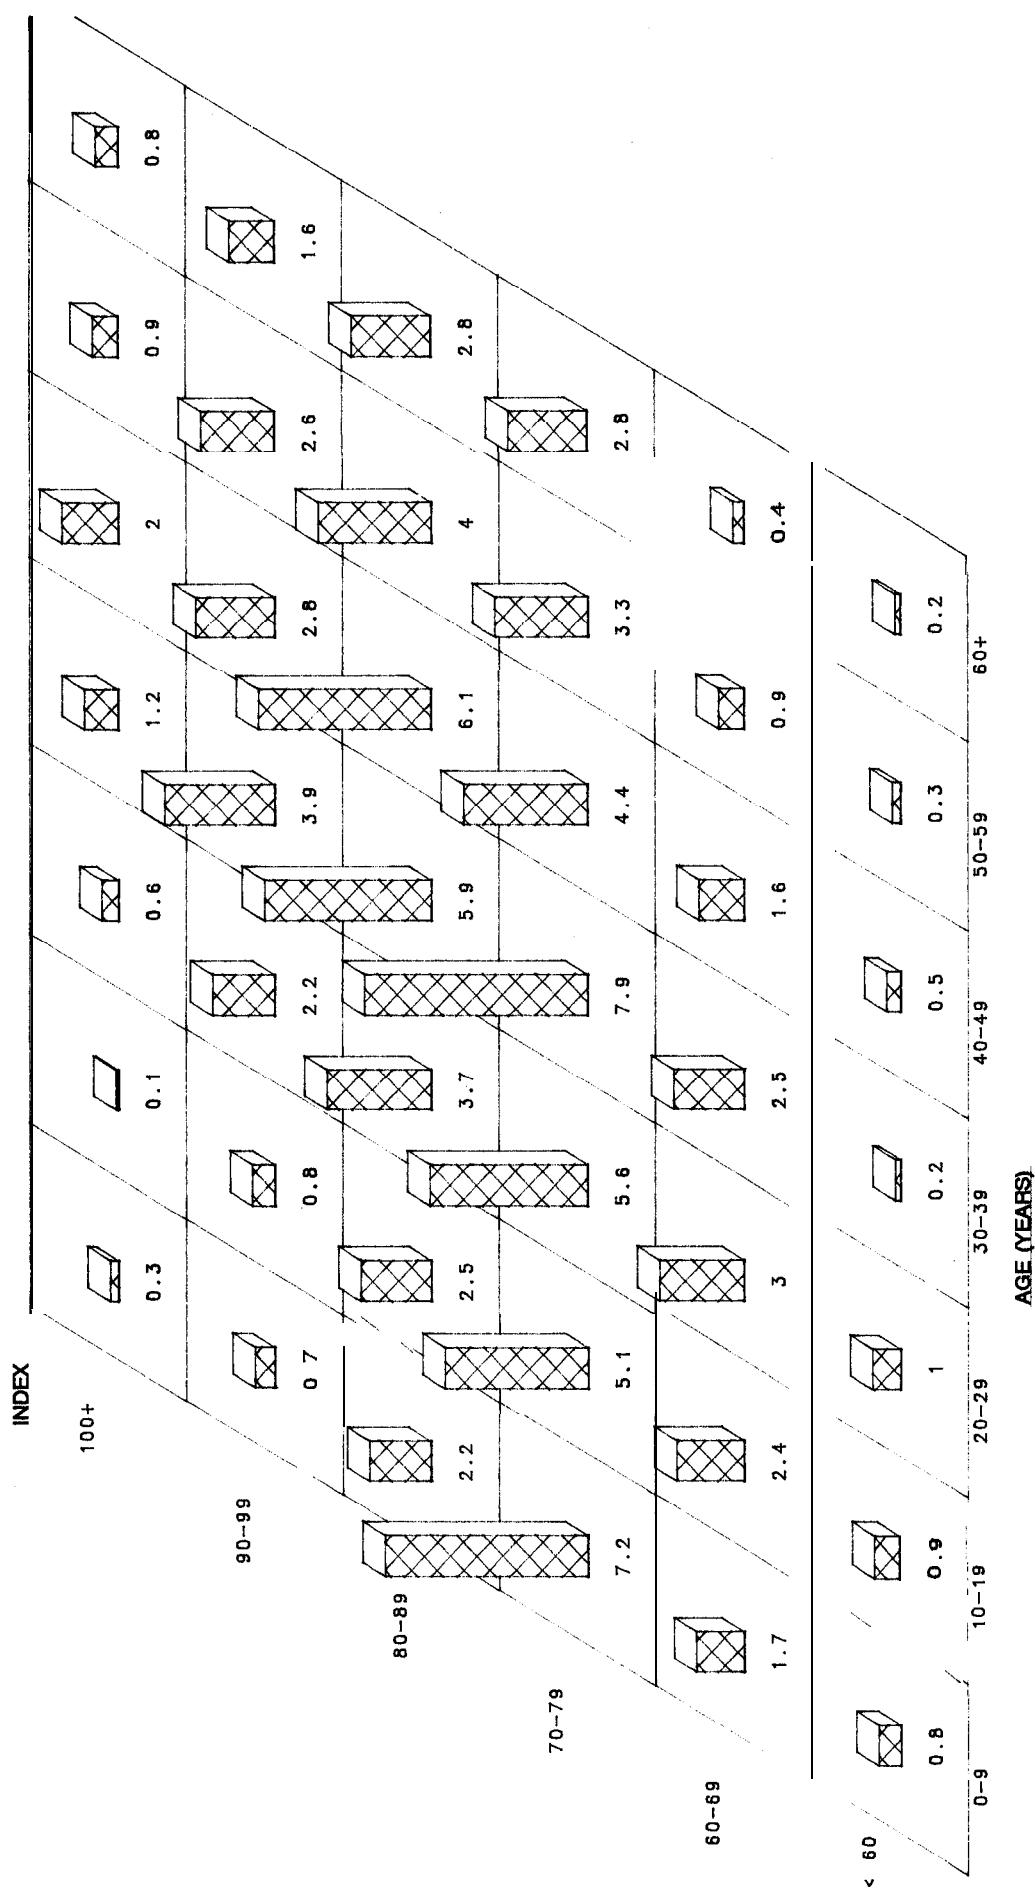

Figure 18A.-Percentage distribution of natural loblolly pine stands in the Coastal Plain region of the Southeast, by site index and stand age.
 (Represents 4,325,638 acres. Georgia site index data treated as missing values.)

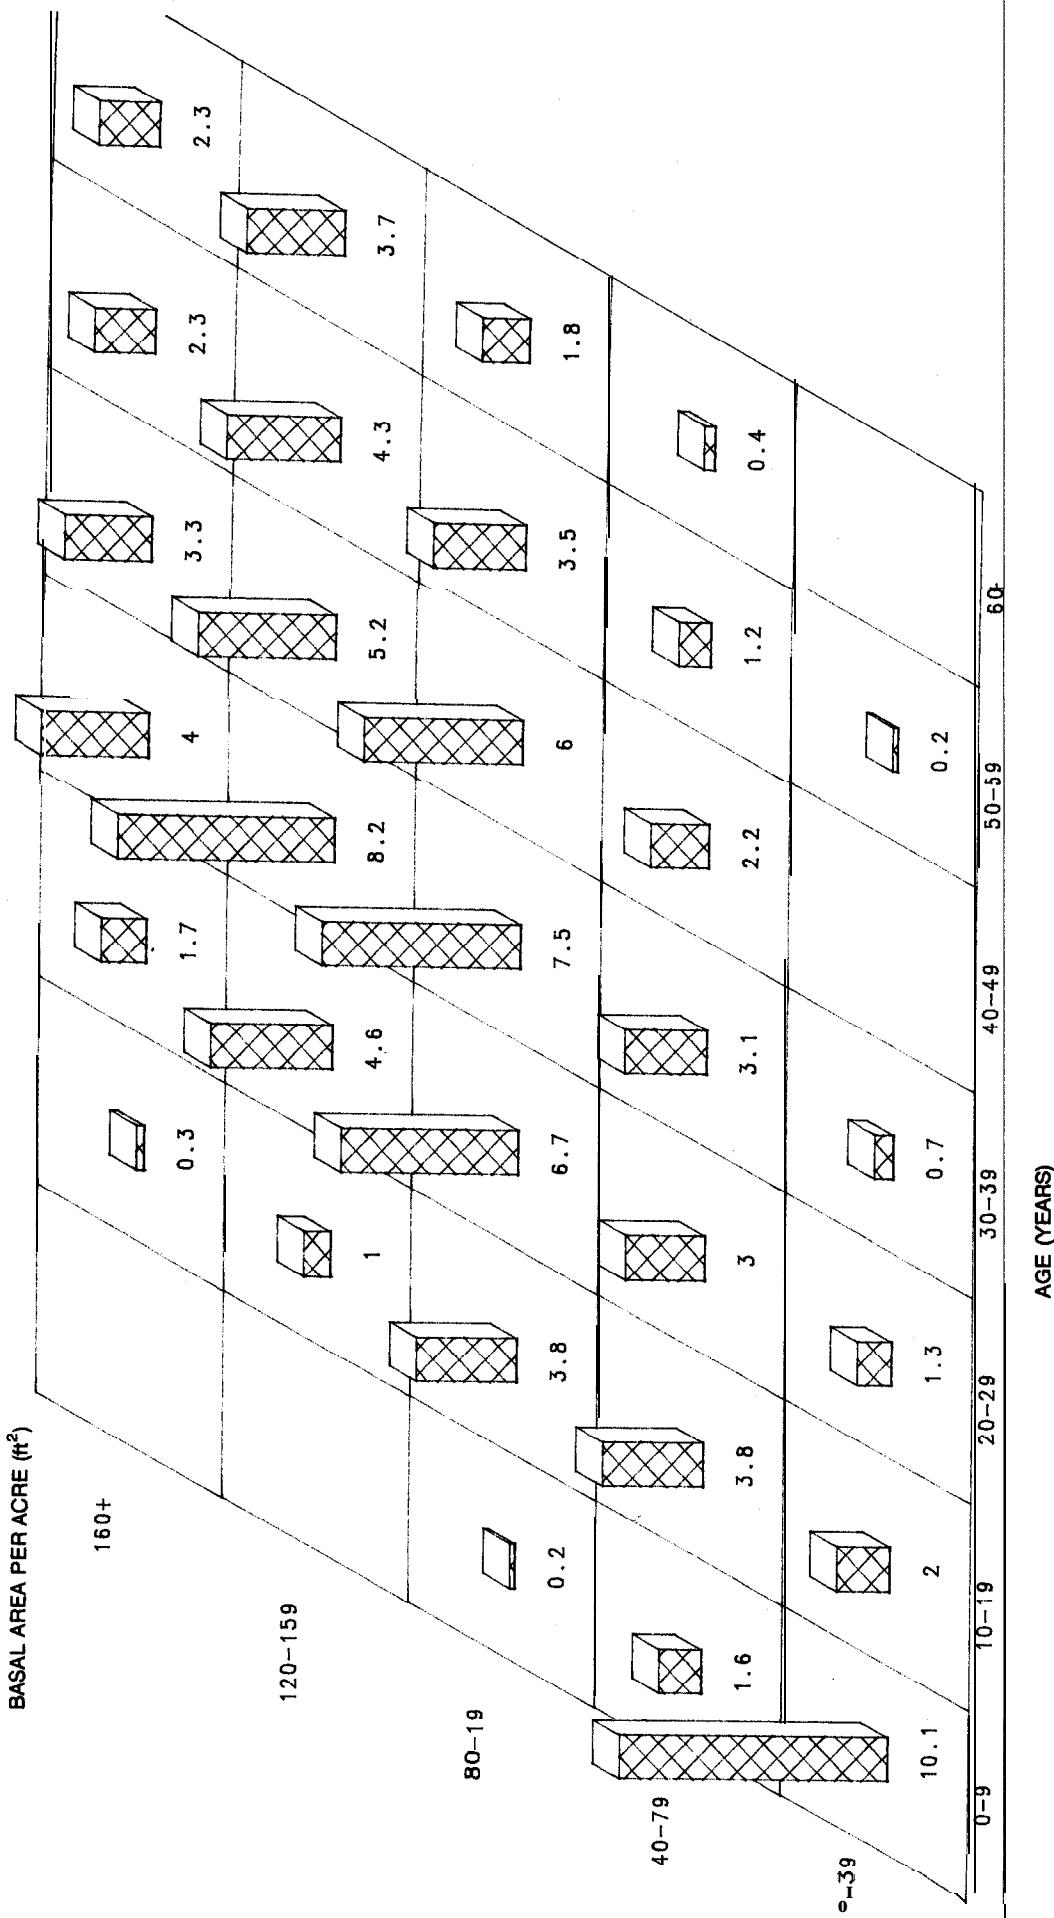

Figure 18B.—Percentage distribution of natural loblolly pine stands in the Coastal Plain region of the Southeast, by basal area per acre and stand age (Represents 4,325,638 acres.)

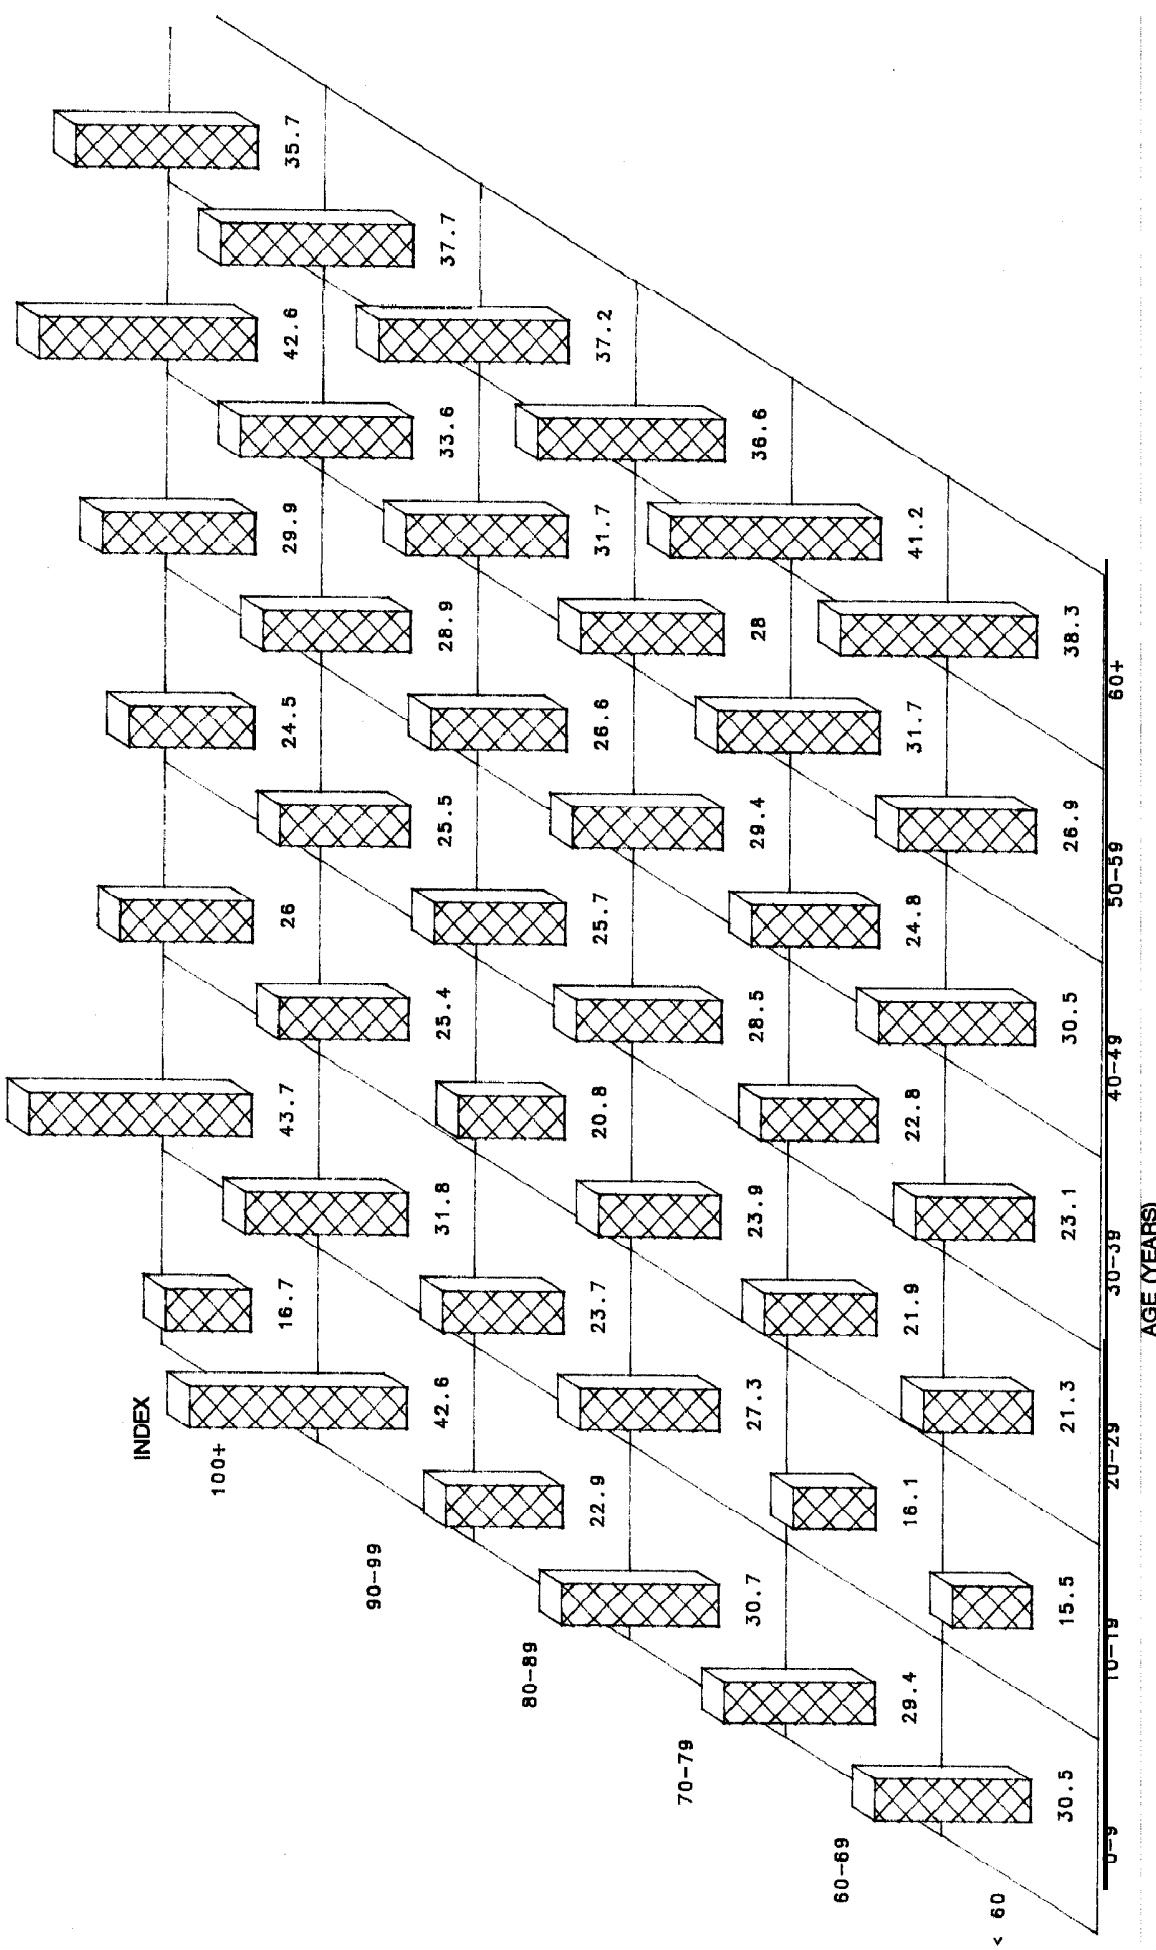

Figure 18C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for natural loblolly pine stands in the Coastal Plain region of the Southeast. (Represents 4,325,638 acres. Georgia site index data treated as missing values.)

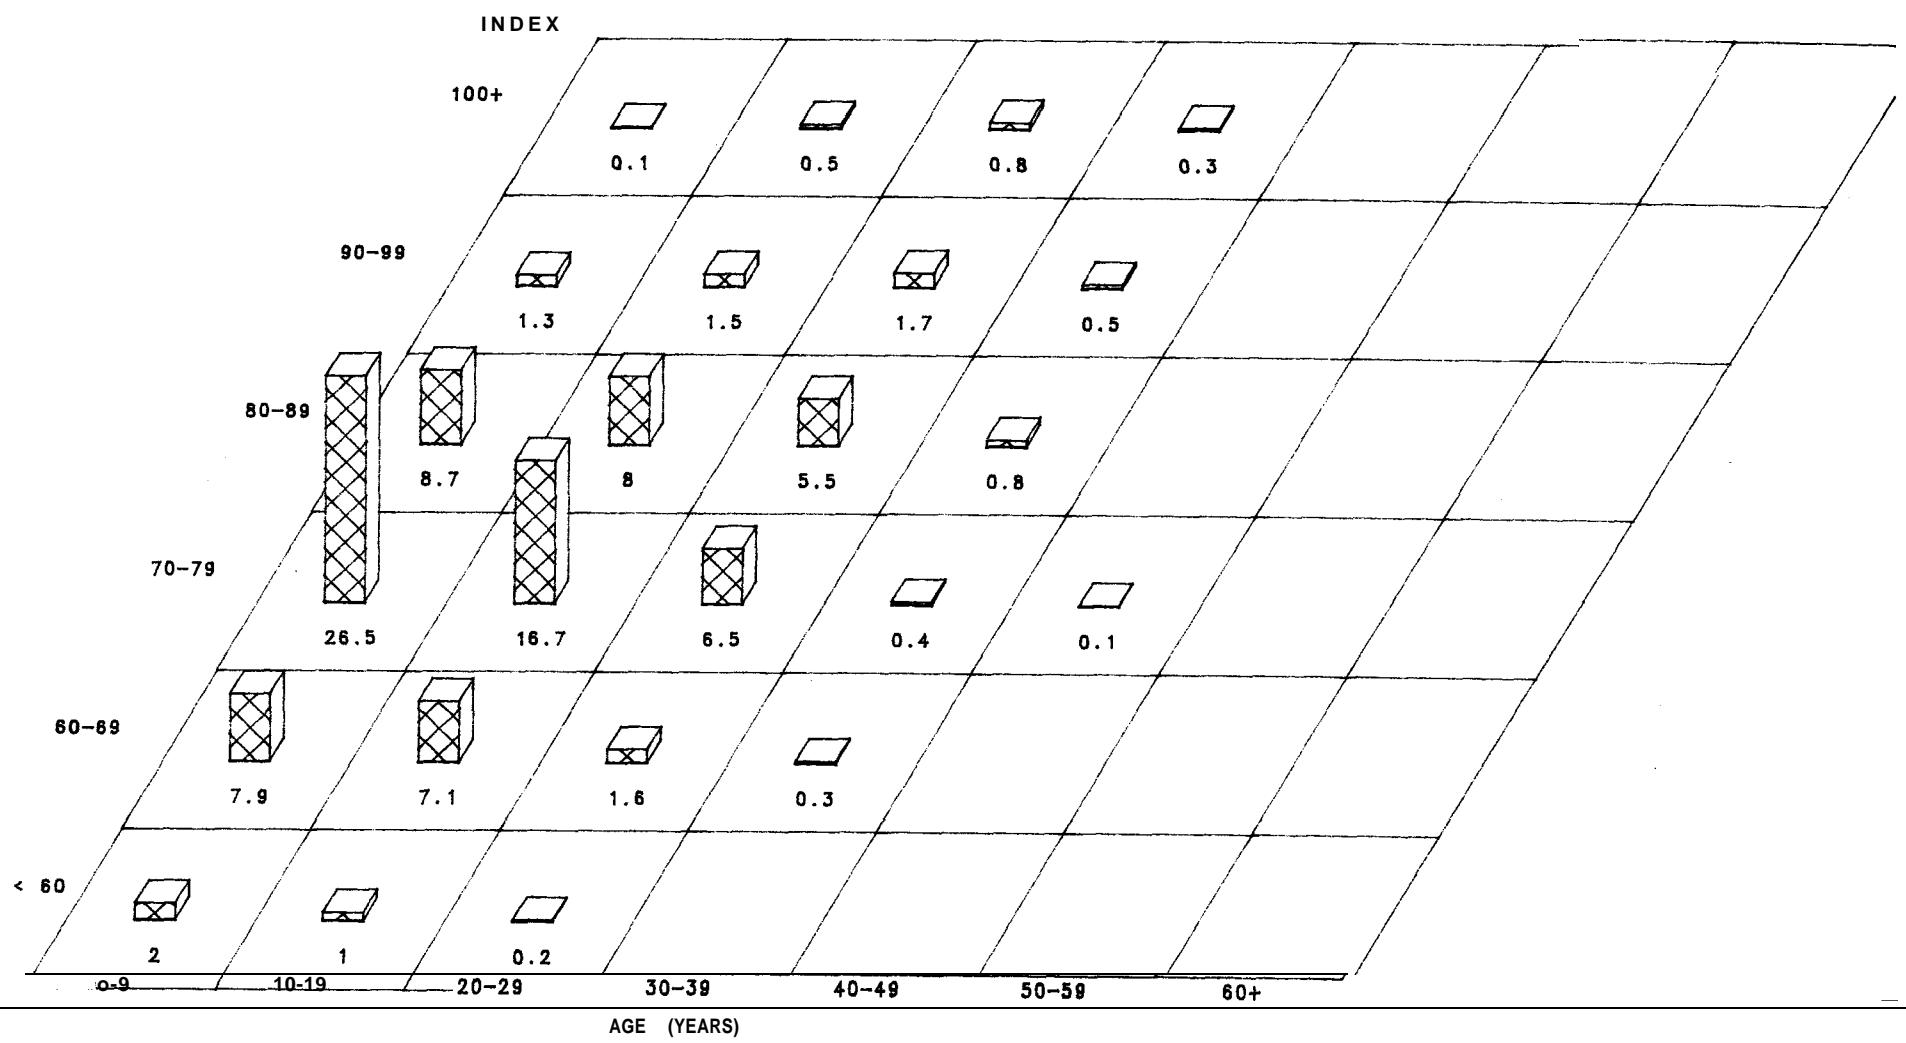

Figure 19A.—Percentage distribution of planted loblolly pine stands in the Coastal Plain region of the Southeast, by site index and stand age.
(Represents 3,249,672 acres. Georgia site index data treated as missing values.)

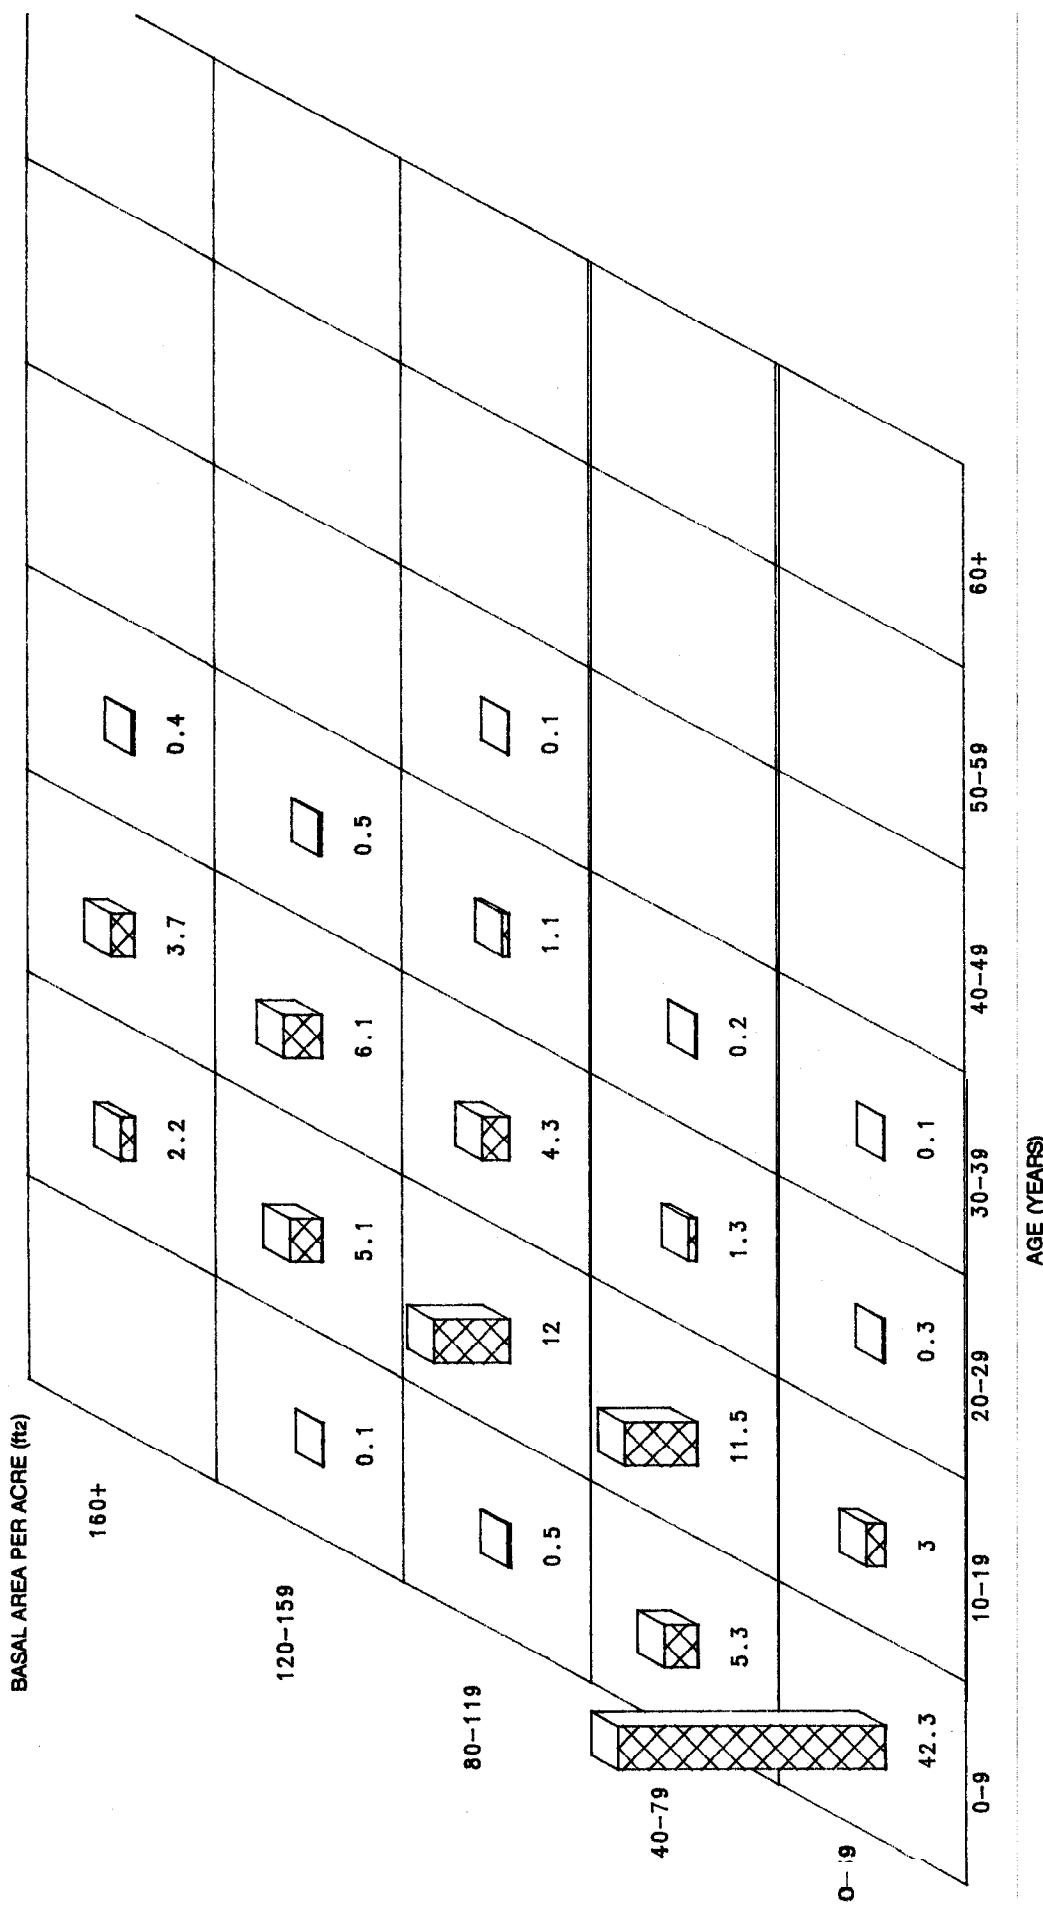

Figure 19B.—Percentage distribution of planted loblolly pine stands in the Coastal Plain region of the Southeast, by basal area per acre and stand age.
(Represents 3,249,672 acres.)

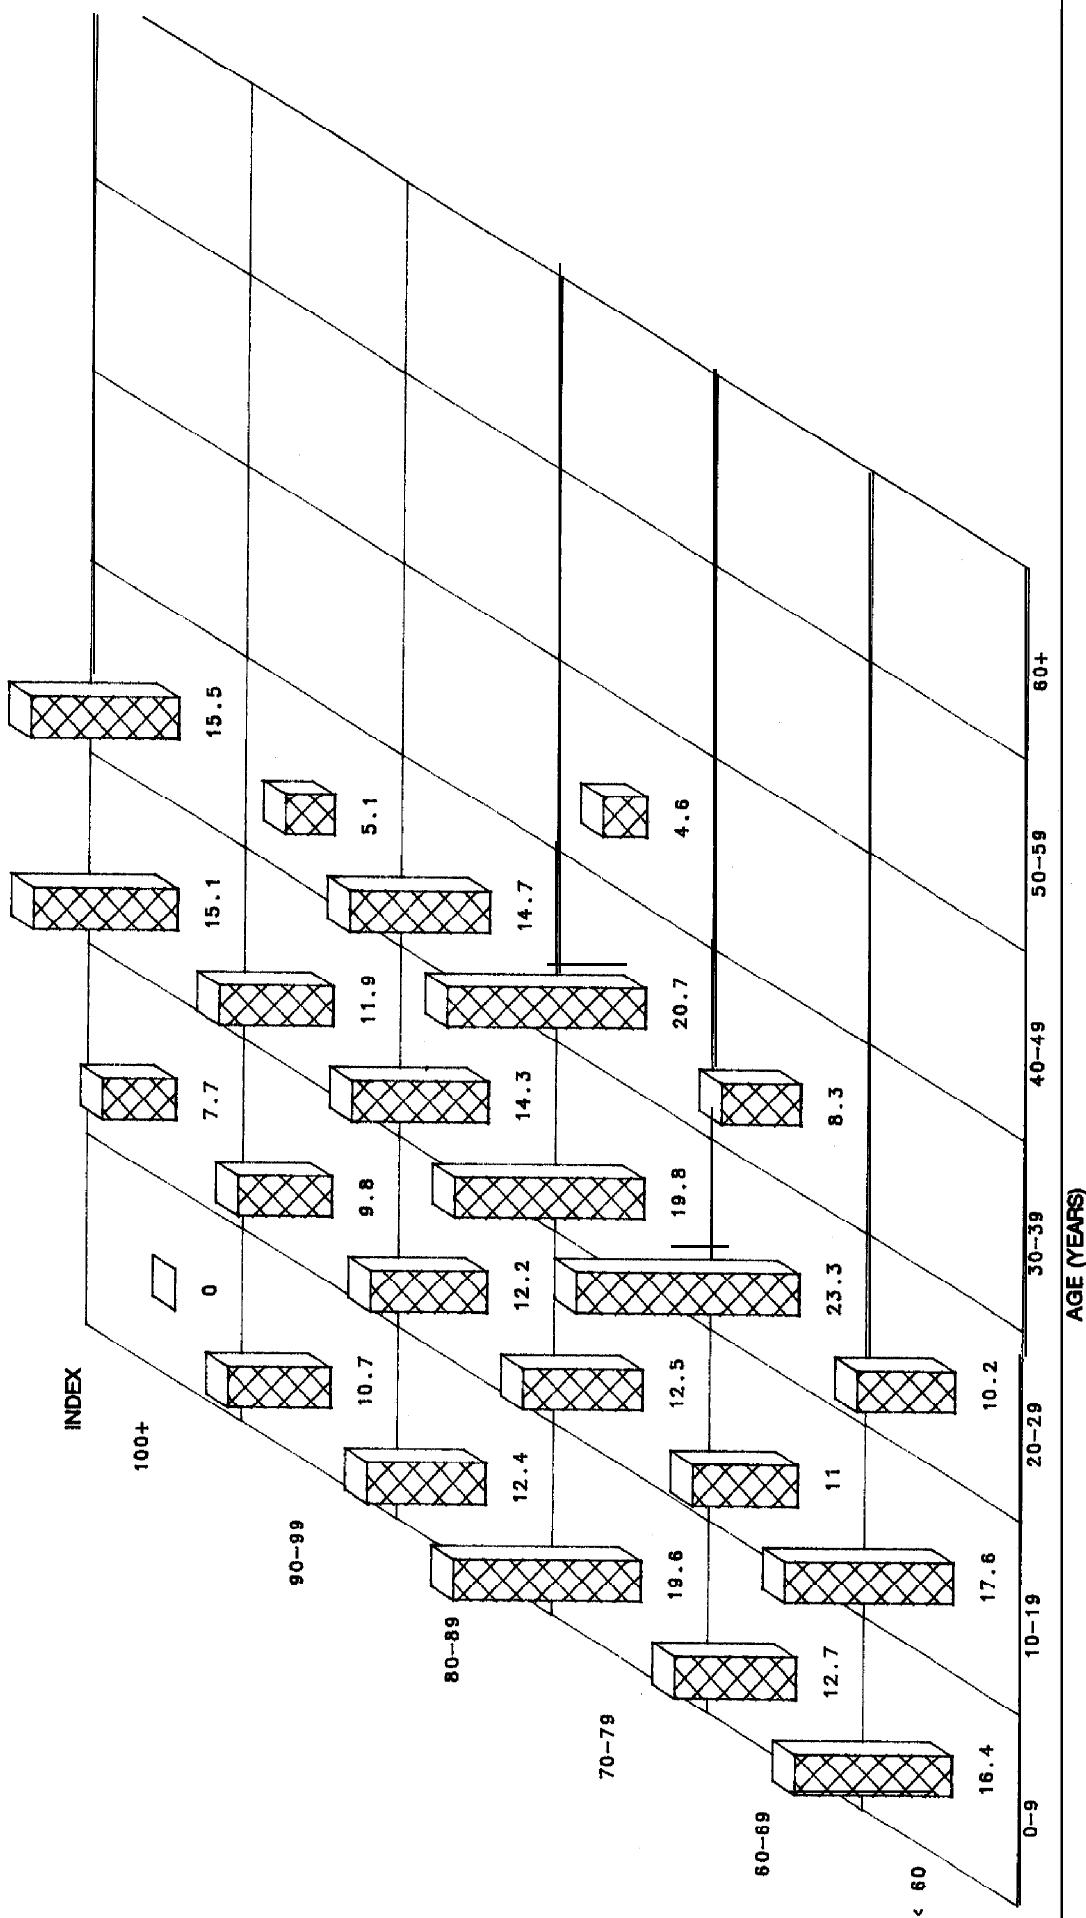

Figure 19C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for planted loblolly pine stands in the Coastal Plain region of the Southeast. (Represents 3,249,672 acres. Georgia site index data treated as missing values.)

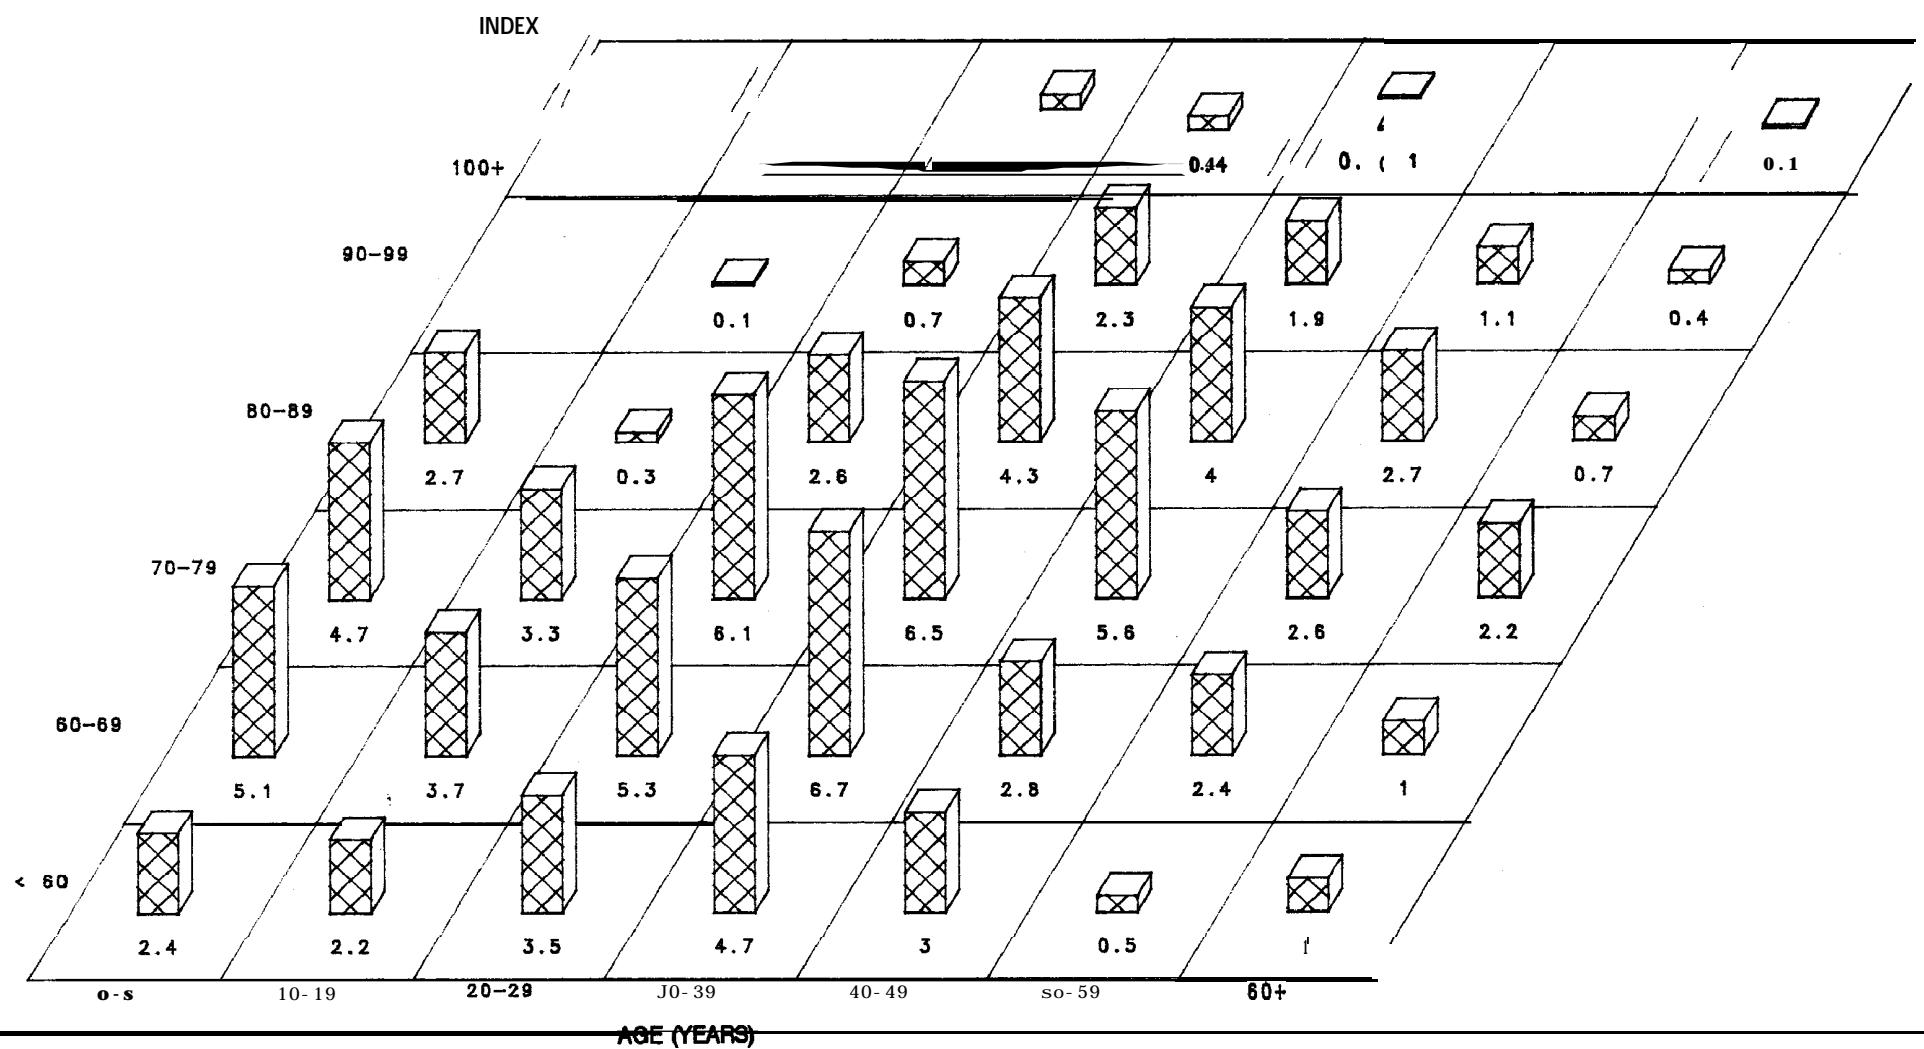

Figure 20A.—Percentage distribution of natural slash pine stands in the Coastal Plain region of the Southeast, by site index and stand age.
 (Represents 3,818,356 acres. Georgia site index data treated as missing values.)

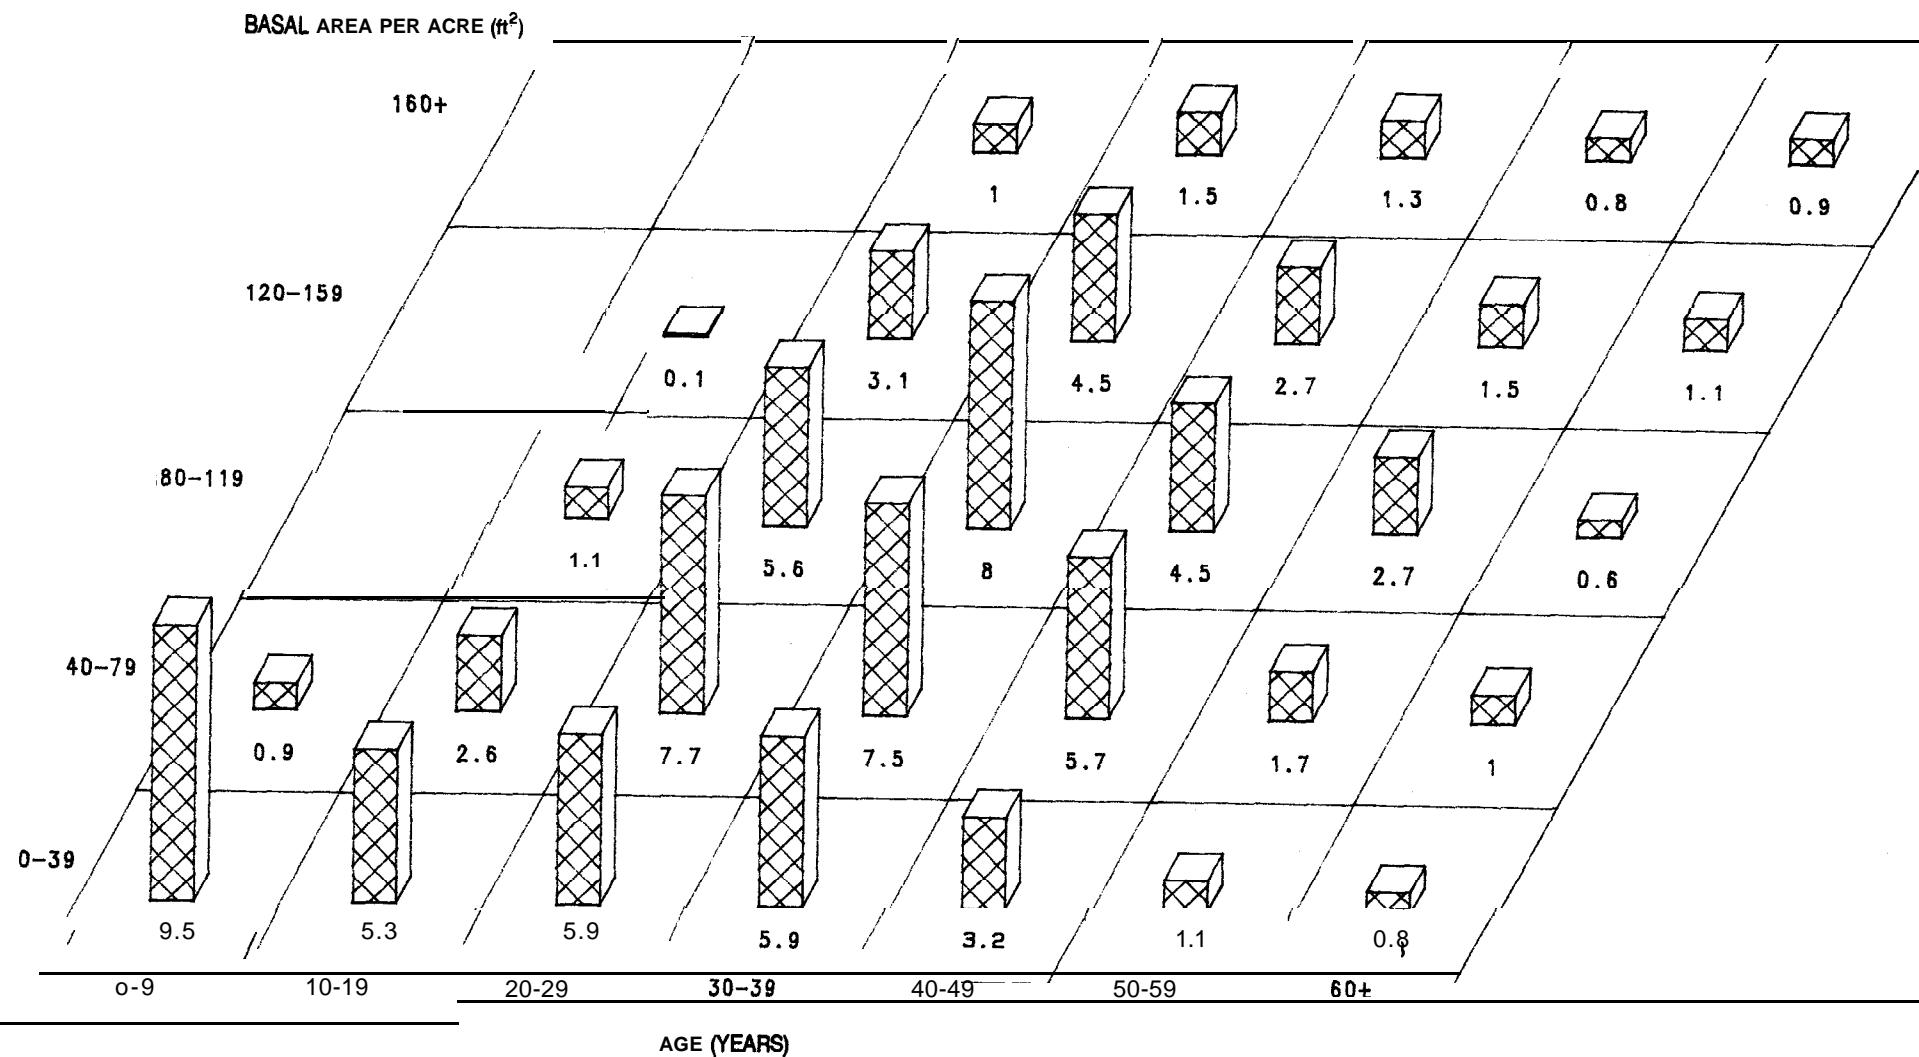

Figure 20B.—Percentage distribution of natural slash pine stands in the Coastal Plain region of the Southeast, by basal area per acre and stand age.
(Represents 5818,358 acres.)

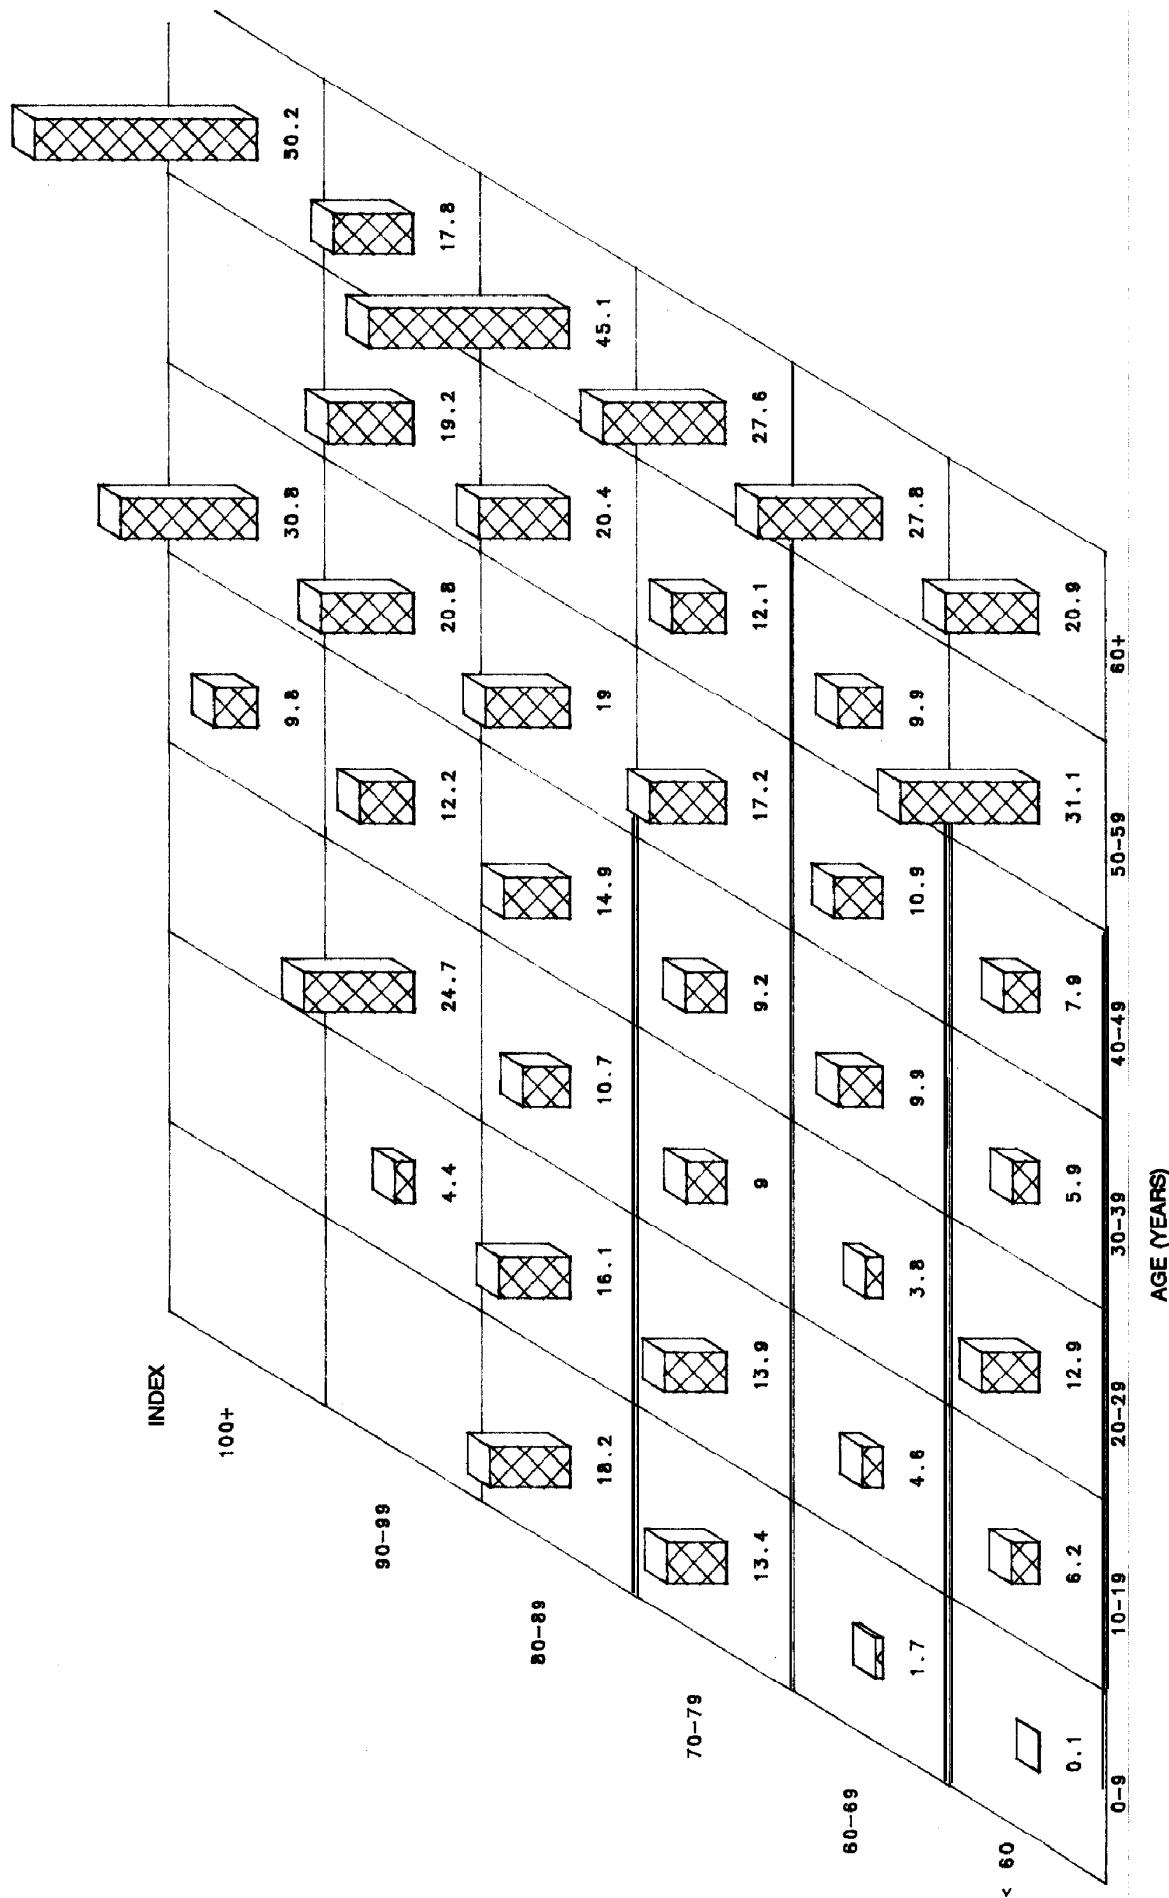

Figure 20C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for natural slash pine stands in the Coastal Plain region of the Southeast. (Represents 3,818,356 acres. Georgia site index data treated as missing values.)

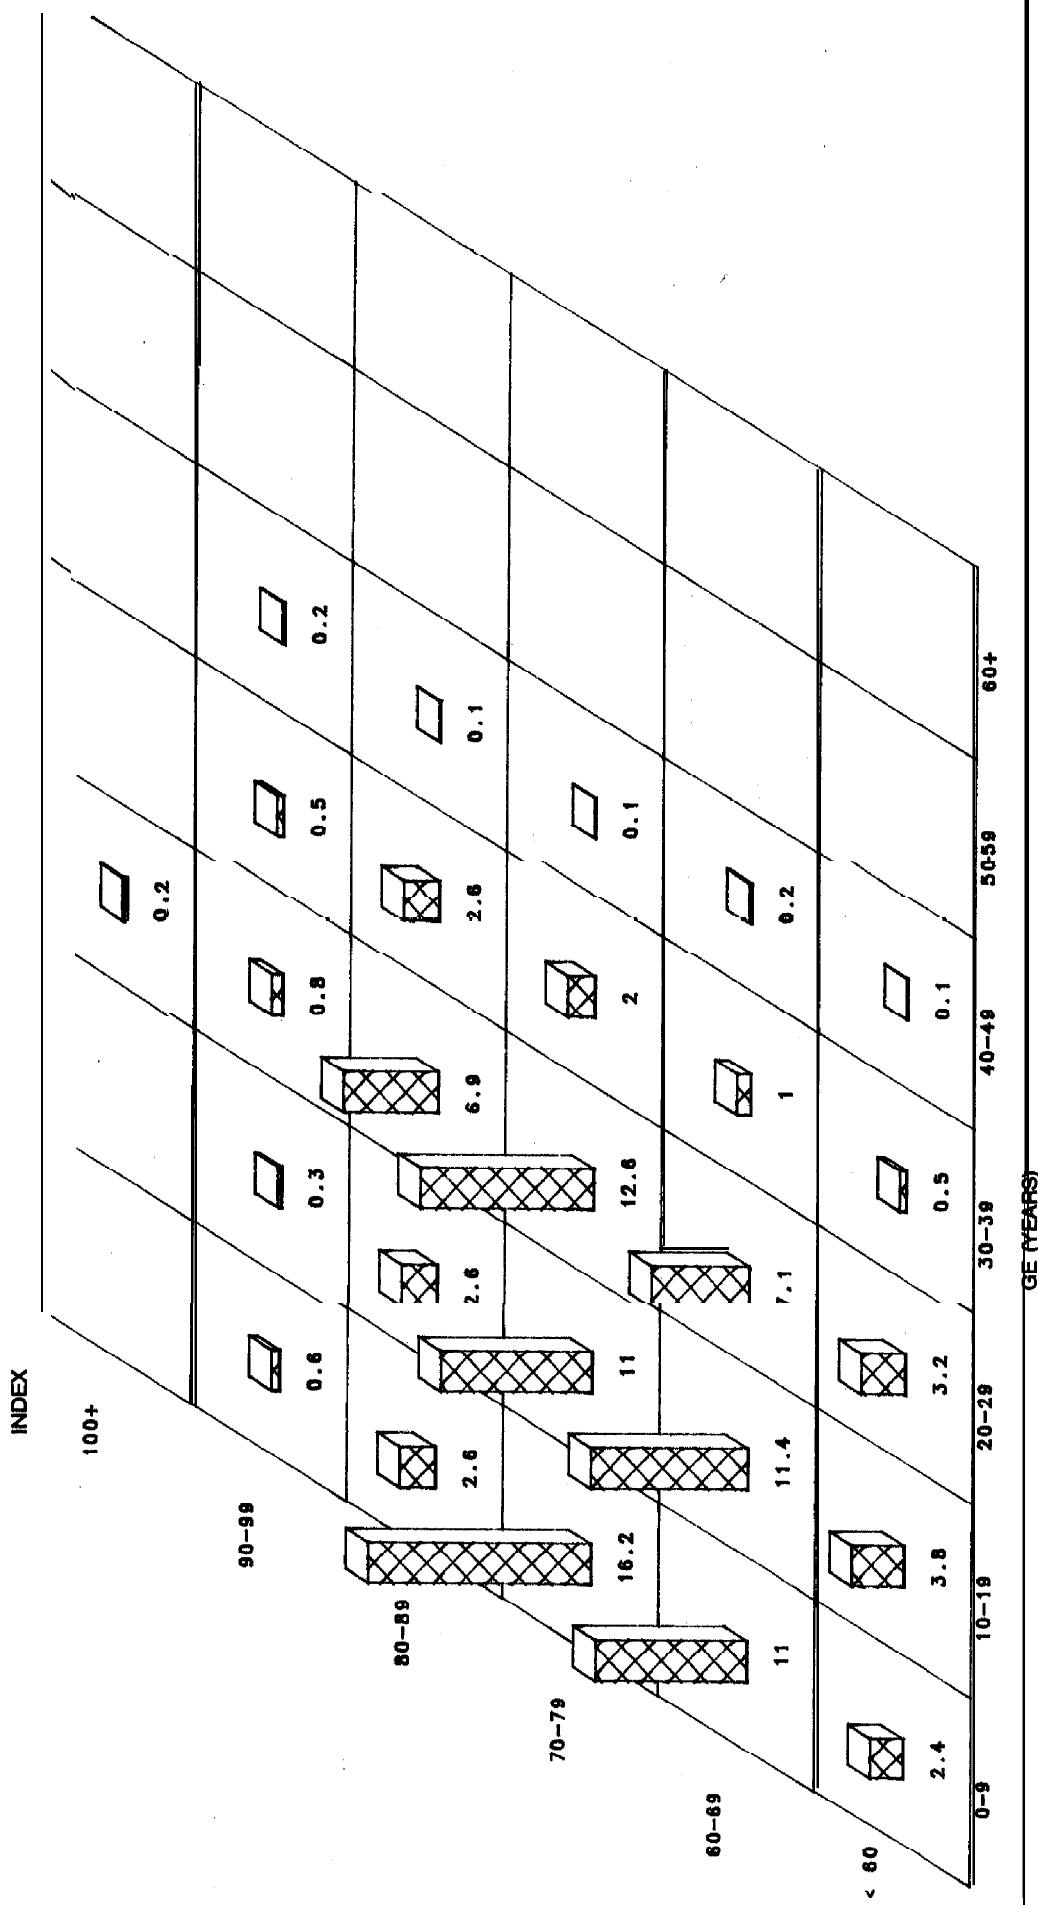

Figure 21A.—Percentage distribution of planted slash pine stands in the Coastal Plain region of the Southeast, by site index and stand age.
(Represents 5,619,115 acres. Georgia site index data treated as missing values.)

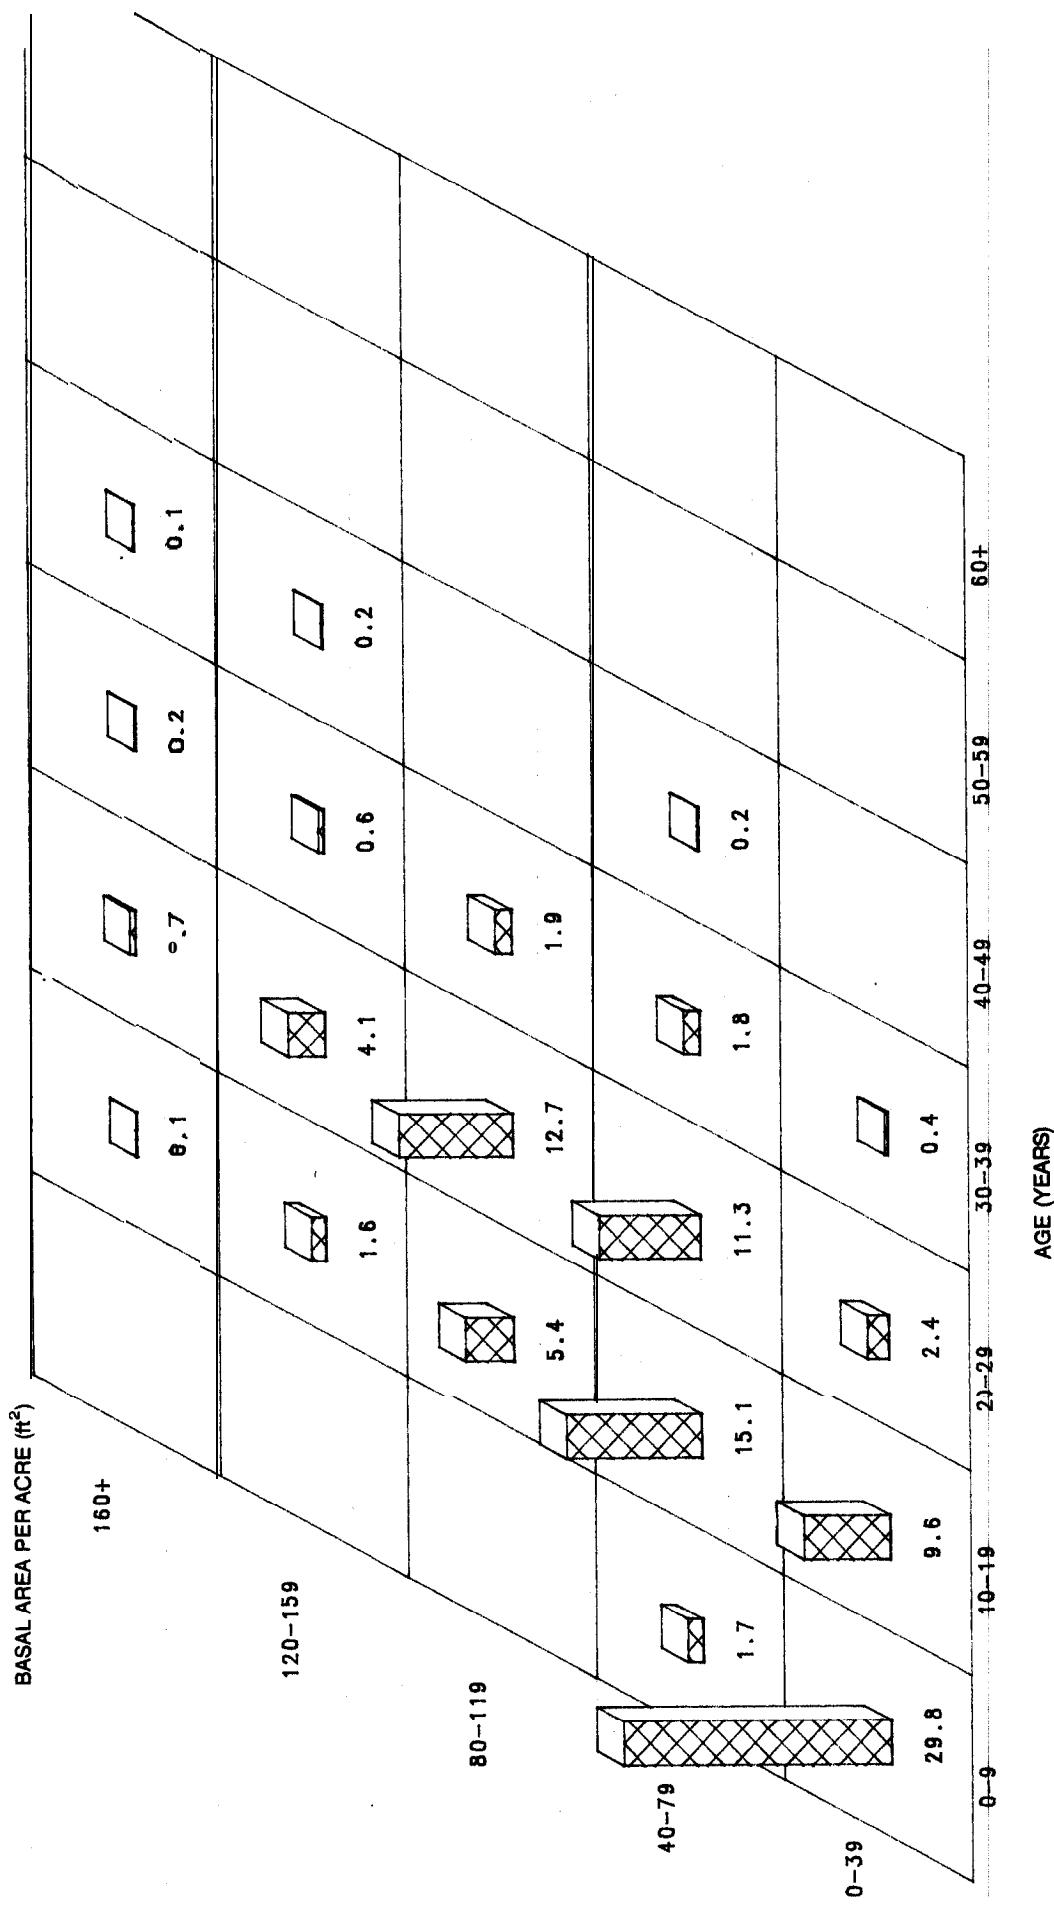

Figure 21B.—Percentage distribution of planted slash pine stands in the Coastal Plain region of the Southeast, by basal area per acre and stand age. (Represents 5,619,115 acres.)

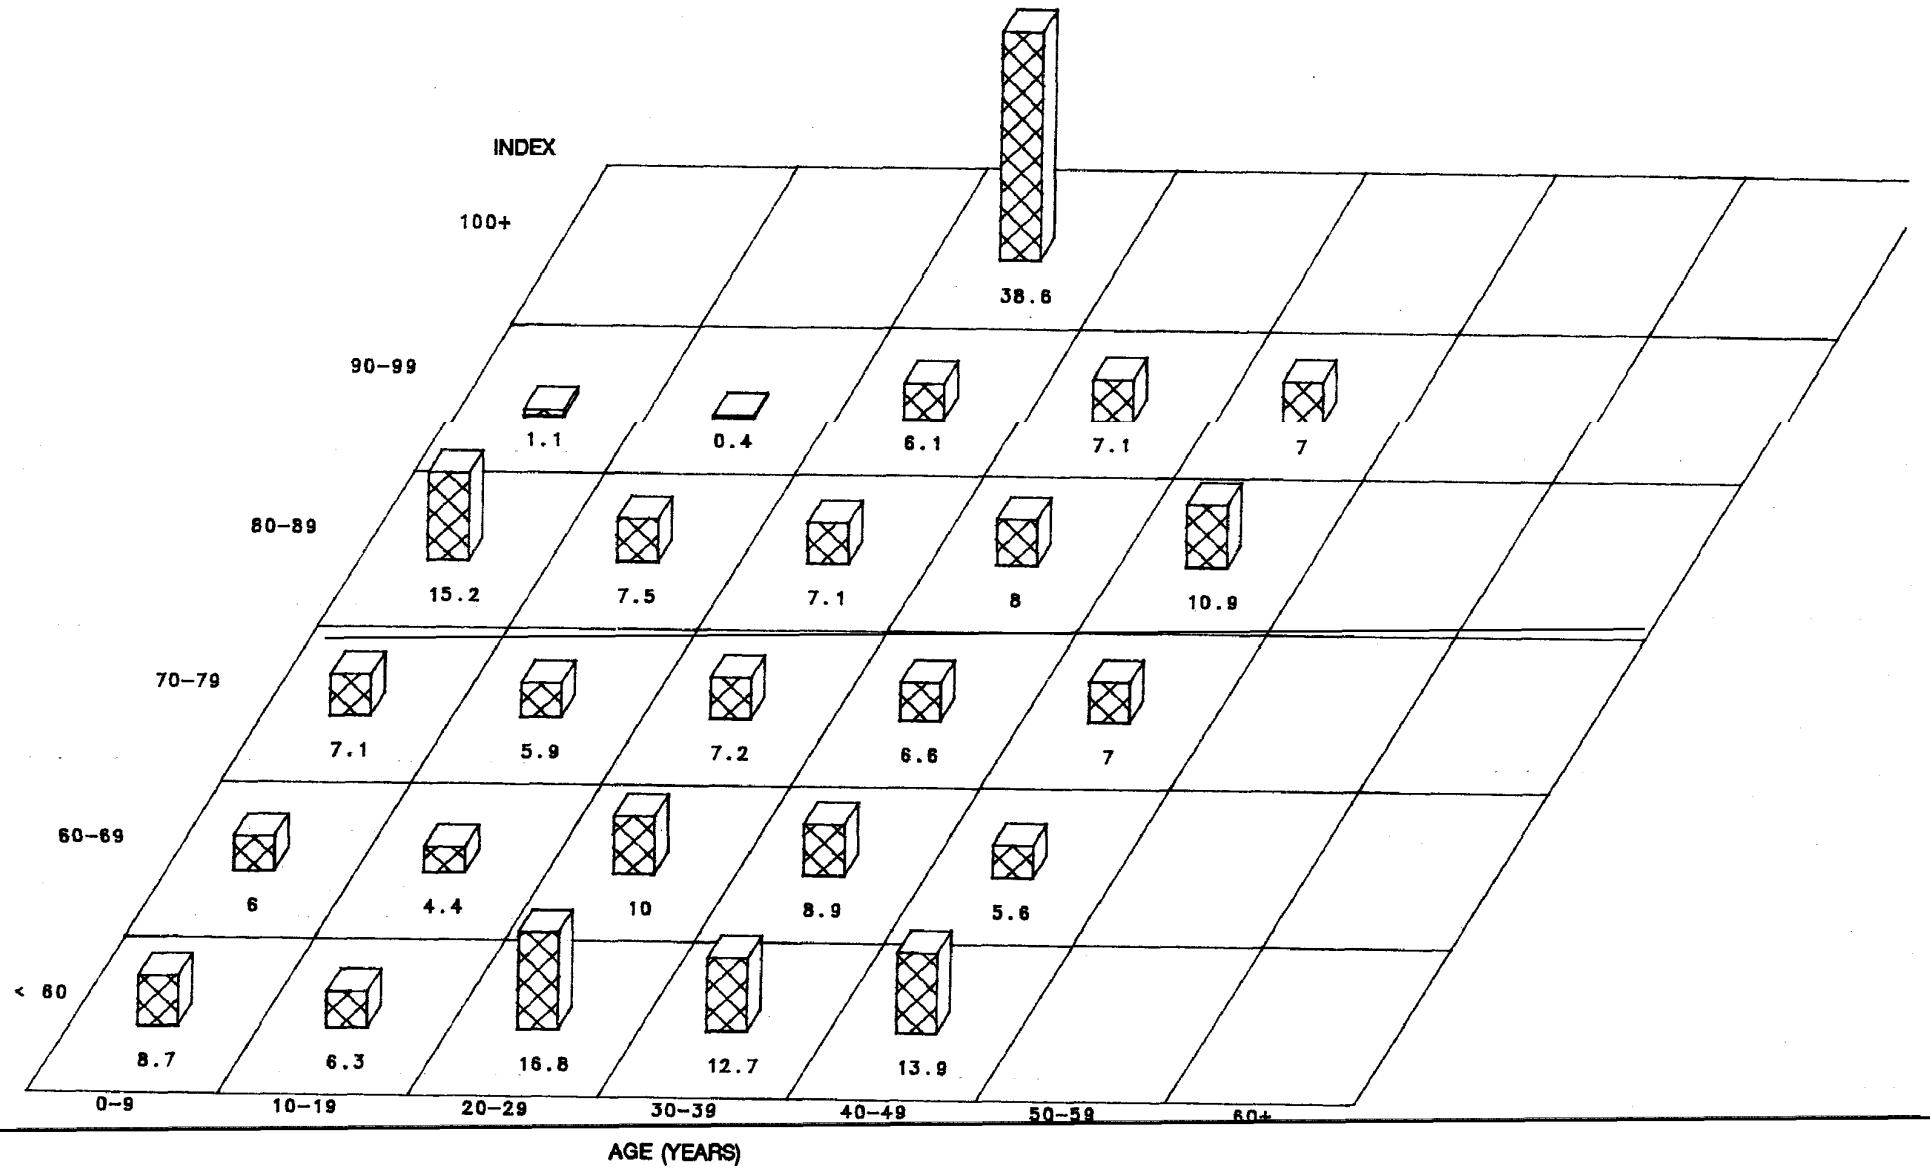

Figure 21 C.-Percentage of **basal** area per acre in non-yellowpine species, by site index and stand age, for planted slash pine stands in the **Coastal Plain** region of the **Southeast**. (Represents 5,619,115 acres. Georgia site index data treated as missing values.)

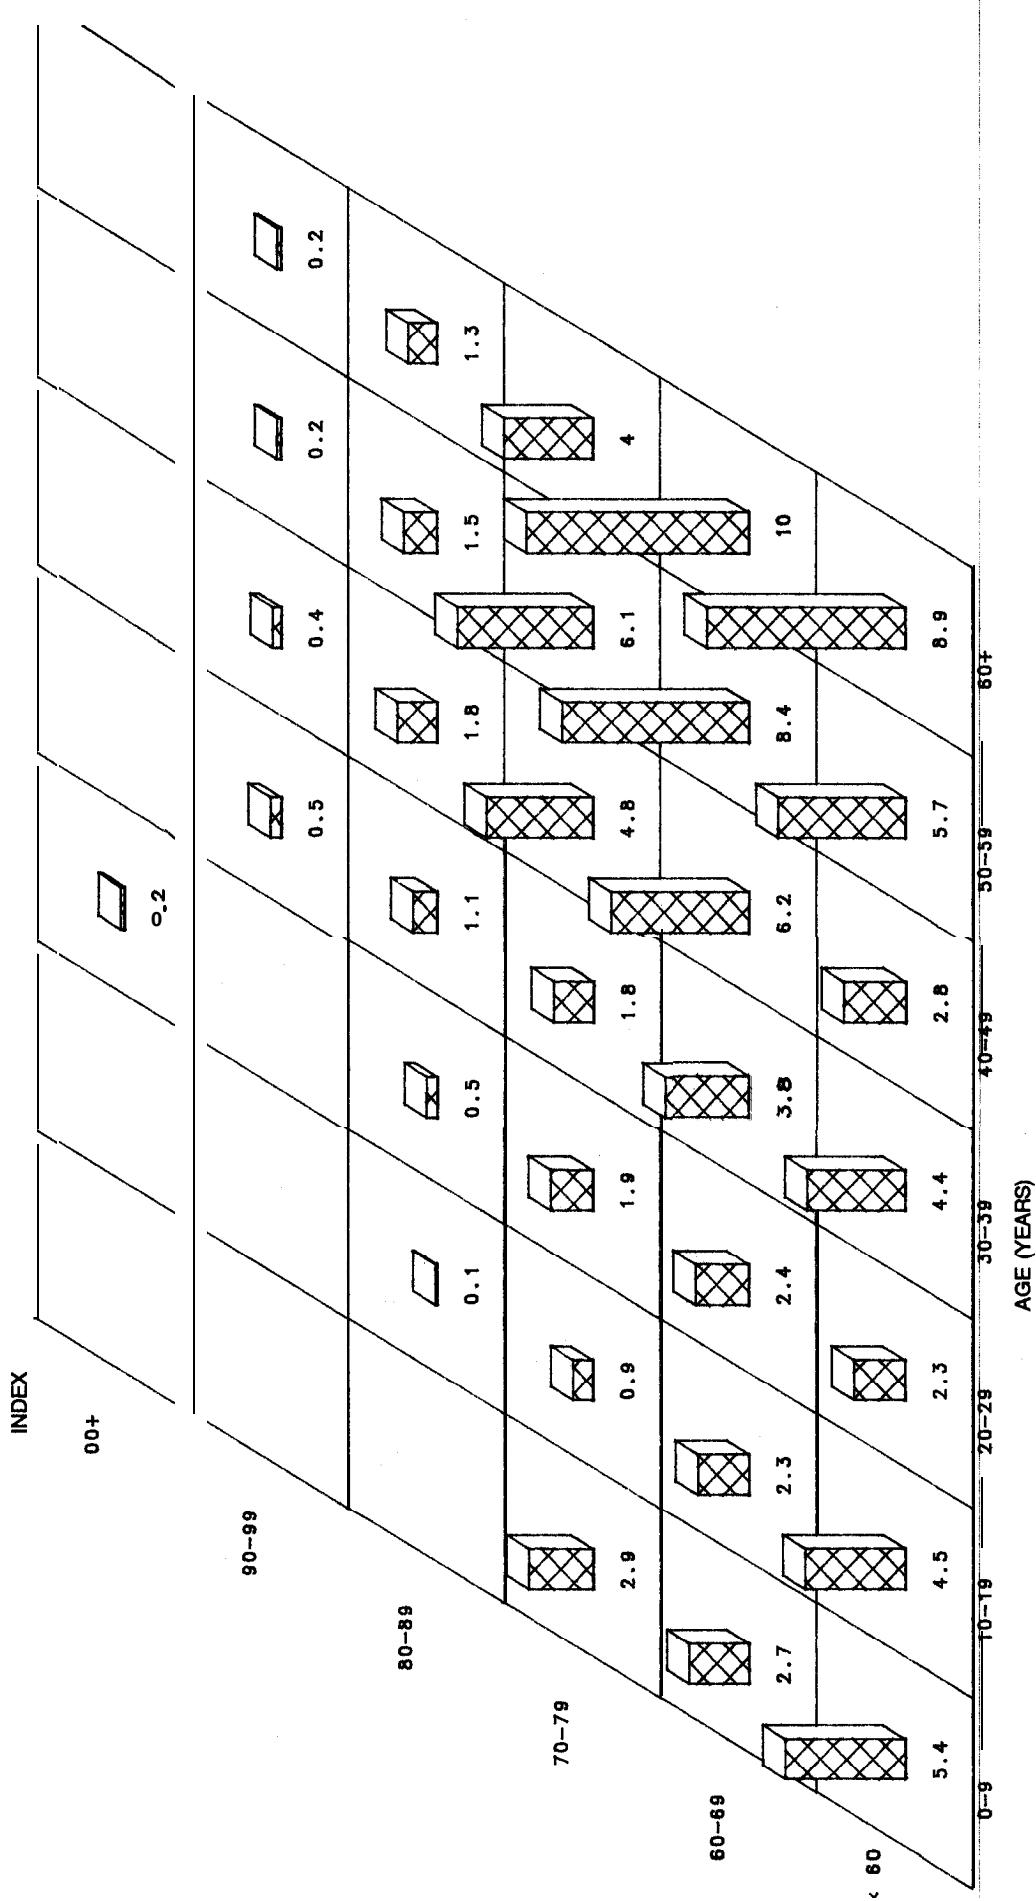

Figure 22A—Percentage distribution of longleaf pine stands in the Coastal Plain region of the Southeast, by site index and stand age.
(Represents 2,125,067 acres of natural stands, and 183,555 acres of planted stands. Georgia site index data treated as missing values.)

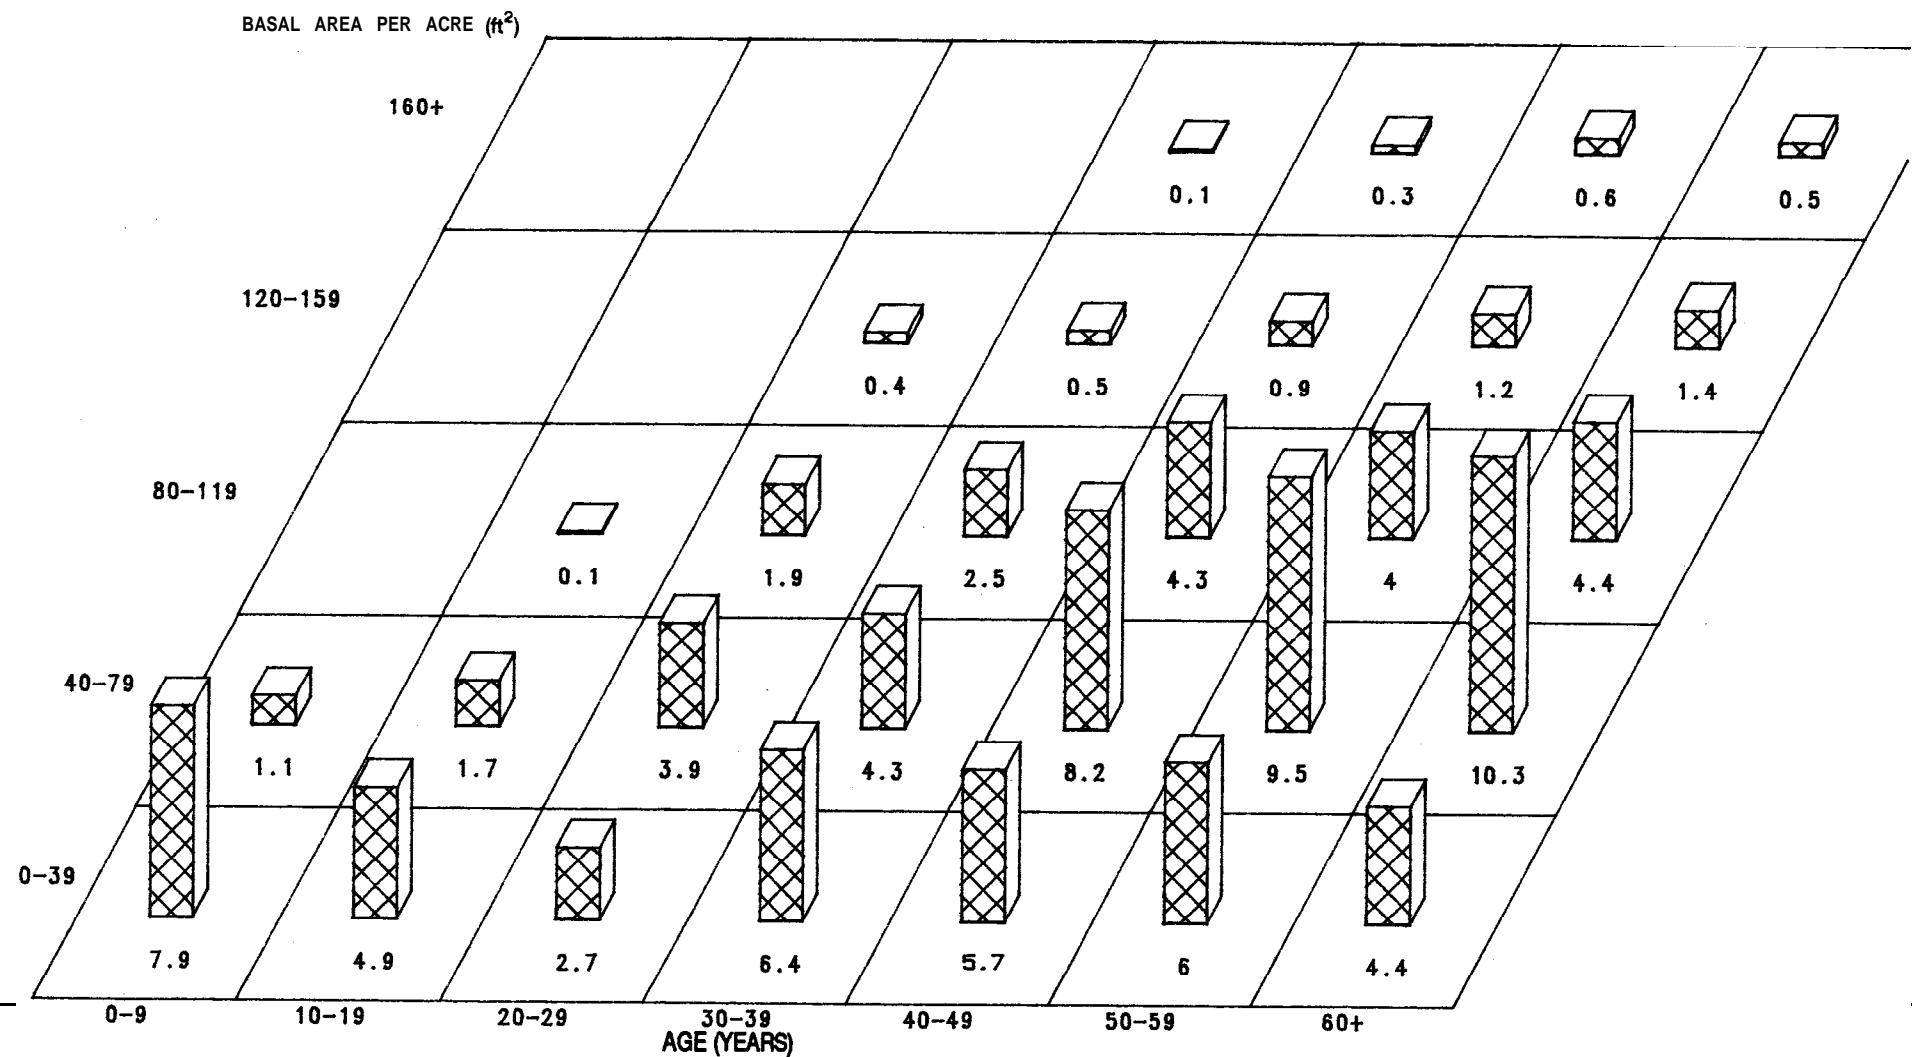

Figure 22B.—Percentage distribution of longleaf pine stands in the Coastal Plain region of the Southeast, by basal area per acre and stand age.
(Represents 2,125,067 acres of natural stands, and 183,595 acres of planted stands.)

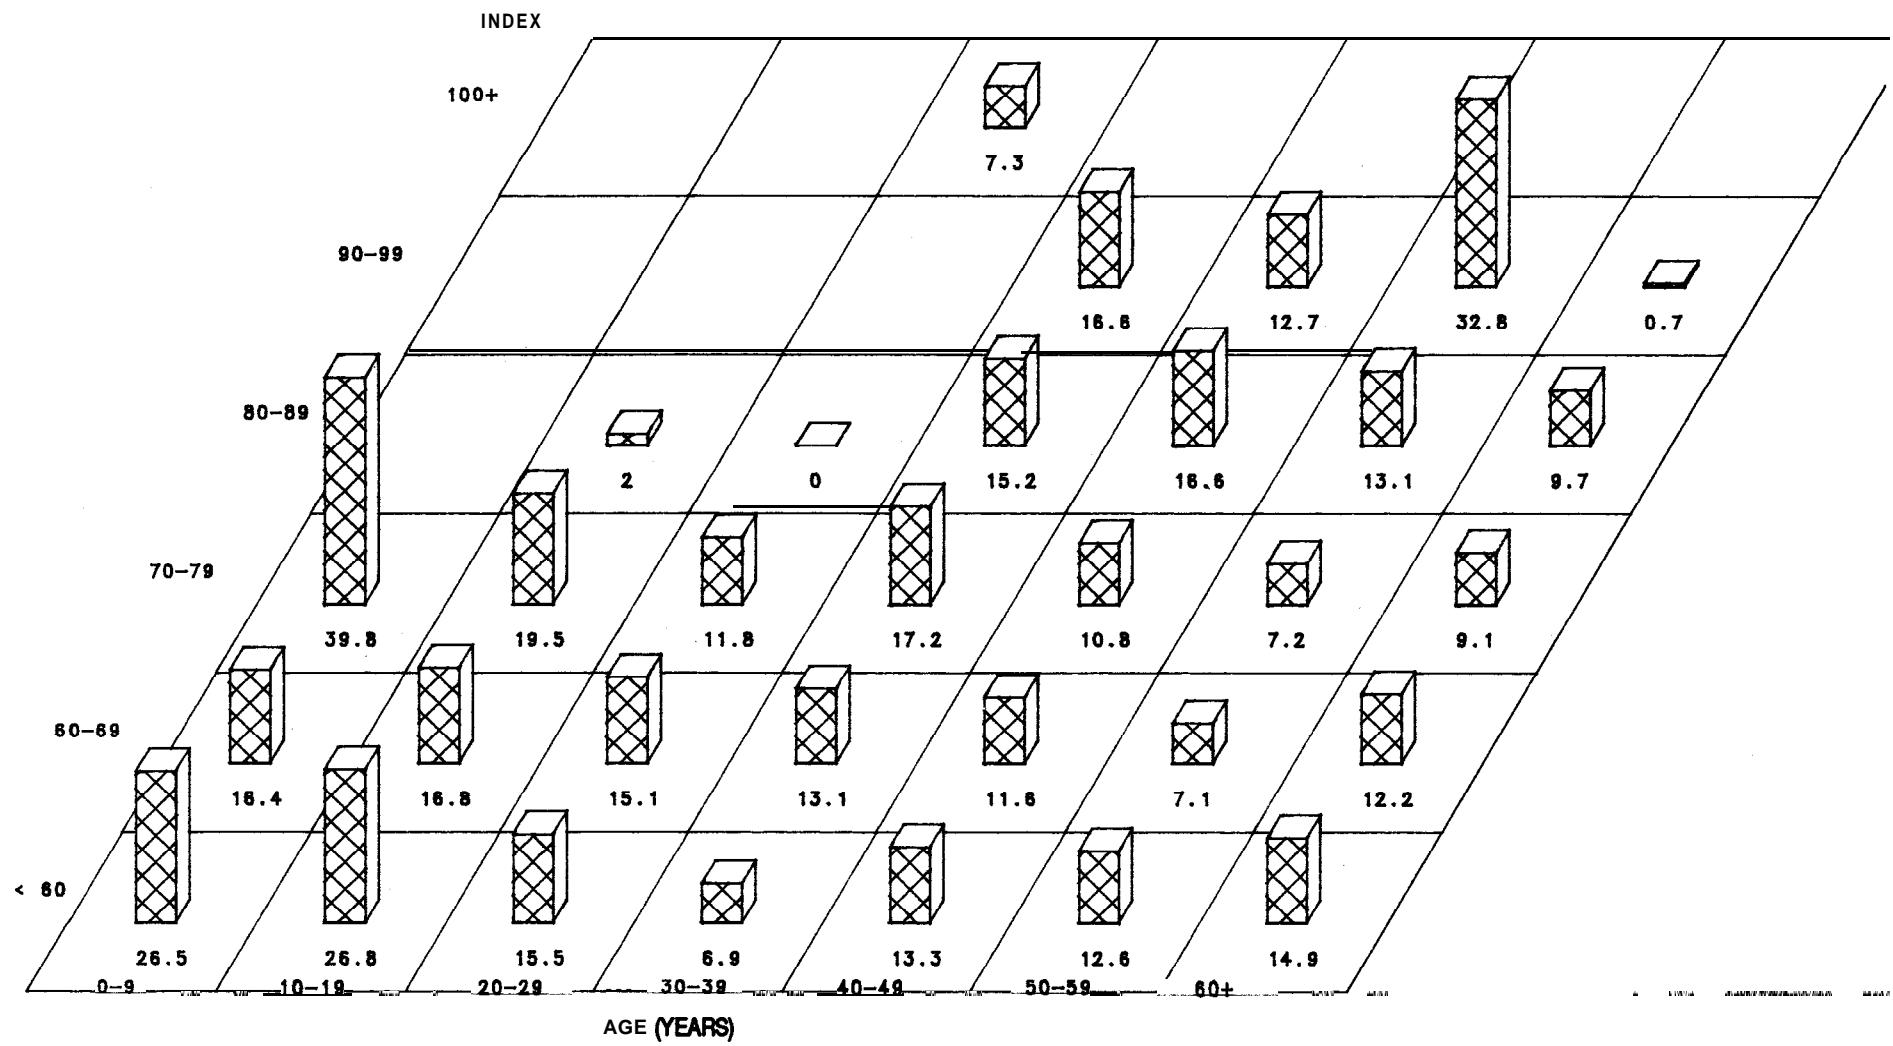

Figure 22C.—Percentage of basal area per acre in **non-yellow-pine species**, by **site index** and stand age, for **longleaf** pine stands in the **Coastal Plain region of the Southeast**. (Represents 2,125,067 acres of **natural stands**, and 183,586 acres of **planted stands**. Georgia site index data treated as **missing values**.)

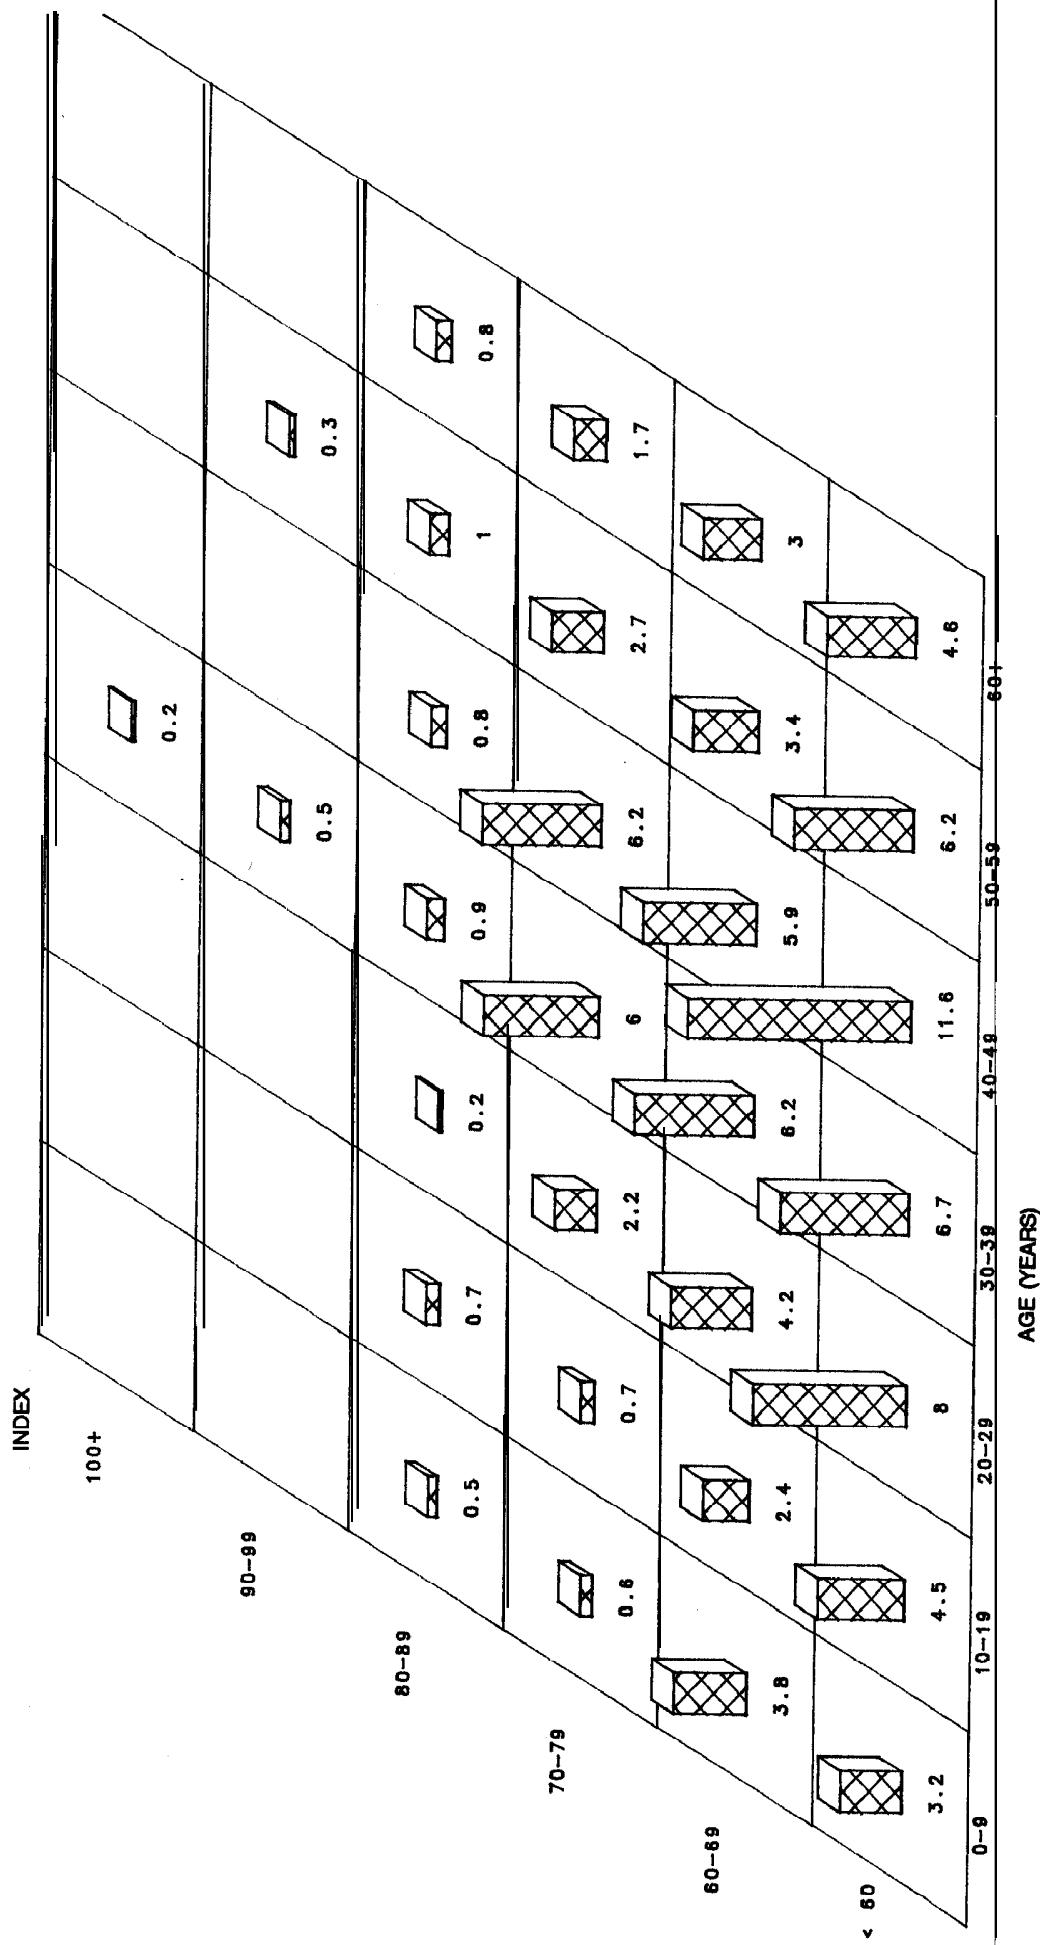

Figure 23A.—Percentage distribution of pond pine stands in the Coastal Plain region of the Southeast, by site index and stand age. (Represents 1,228,253 acres of natural stands, and 11,046 acres of planted stands. Georgia site index data treated as missing values.)

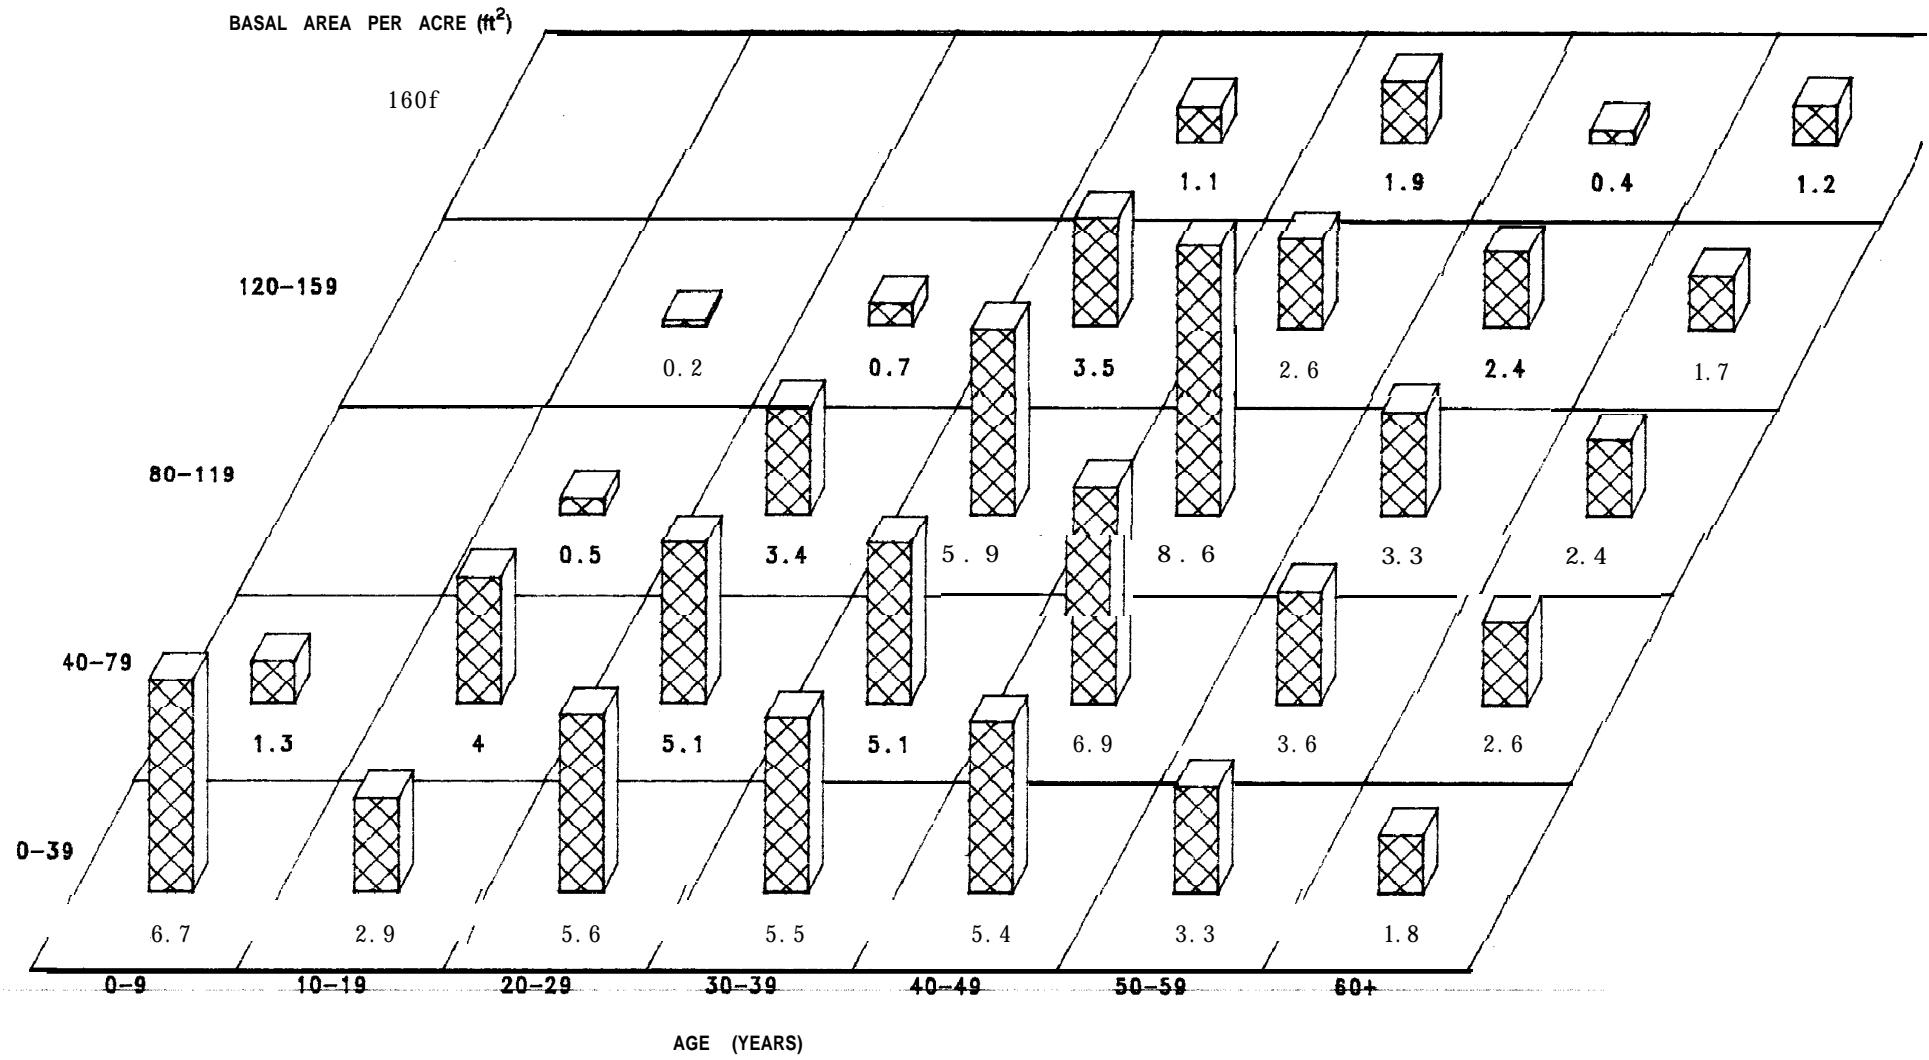

Figure 23B.—Percentage distribution of pond pine stands in the Coastal Plain region of the Southeast, by basal area per acre and stand age.
(Represents 1,228,253 acres of natural stands, and 11,046 acres of planted stands.)

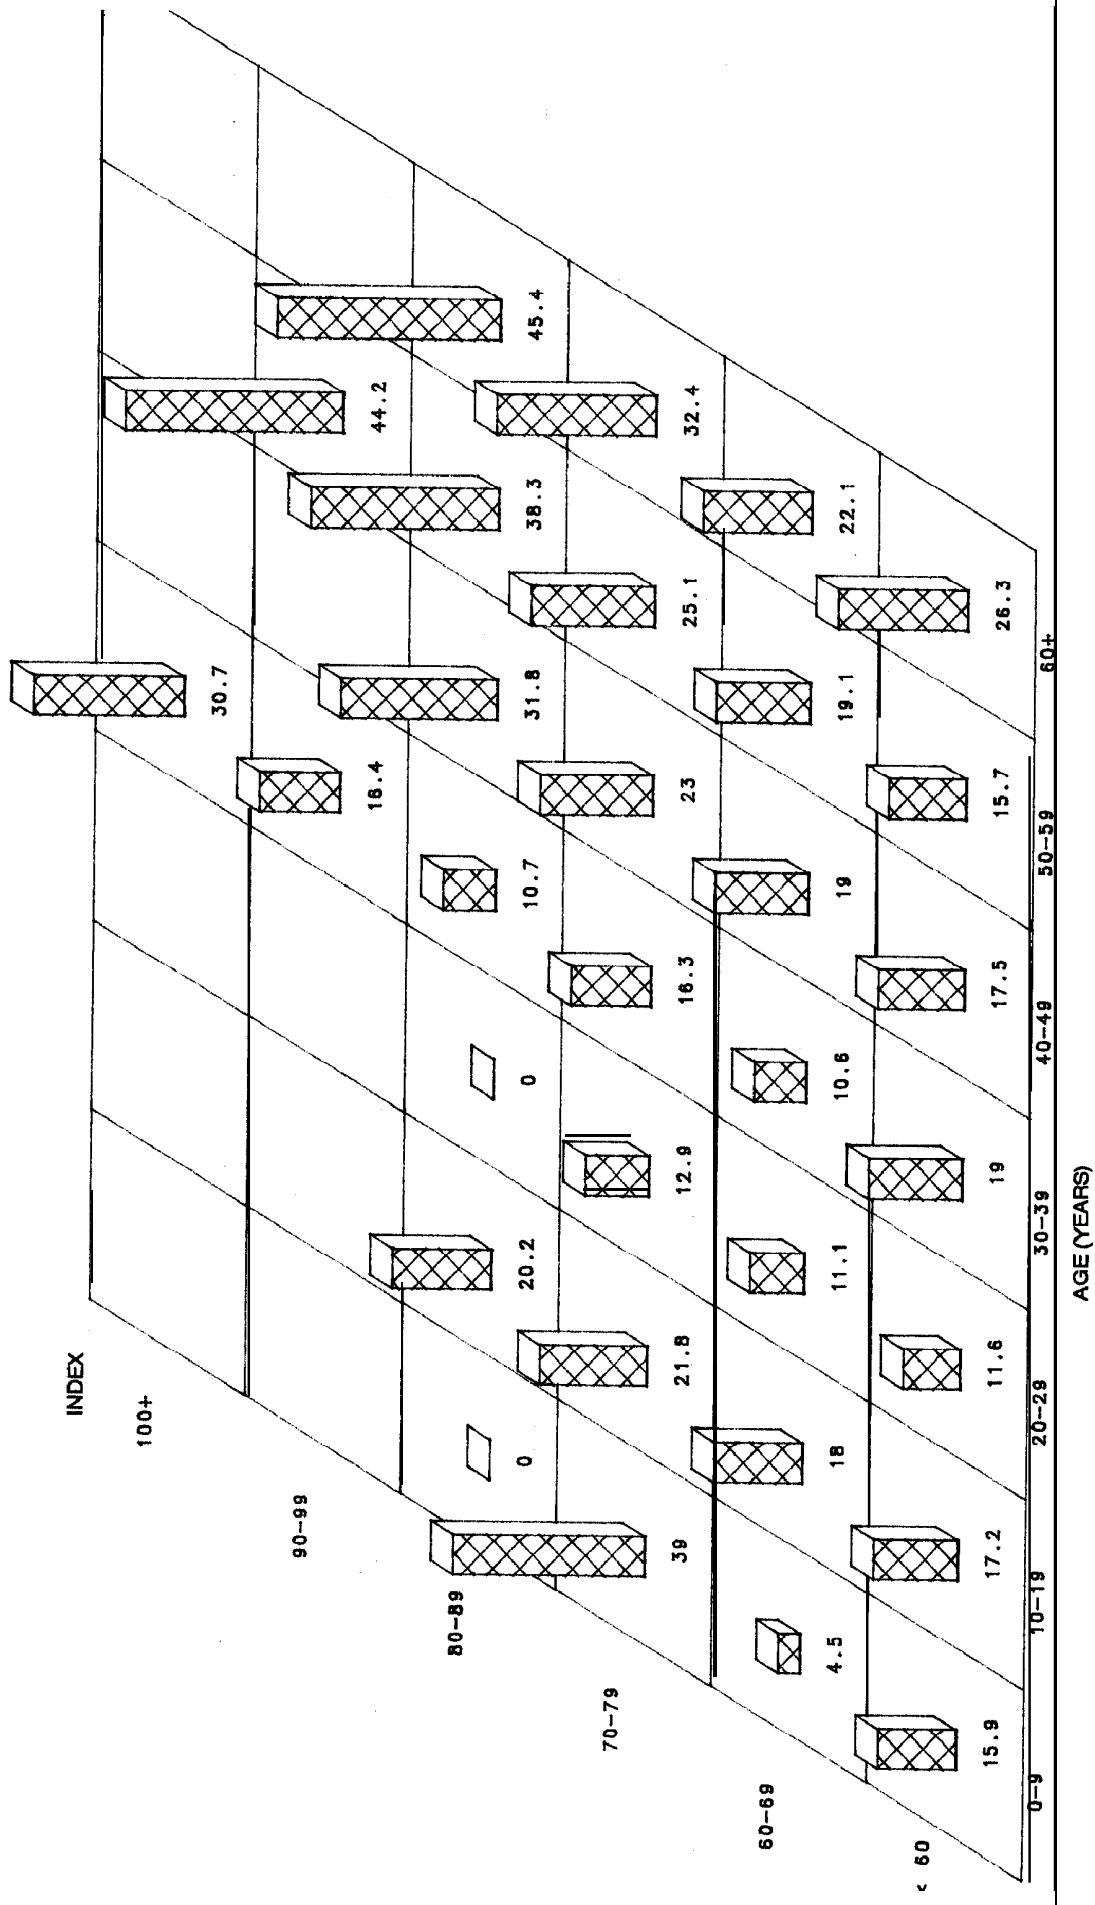

Figure 23C.—Percentage of basal area per acre in non-yellow species, by site index and stand age, for pond pine stands in the Coastal Plain region of the Southeast. (Represents 1,228,253 acres of natural stands, and 11,046 acres of planted stands. Georgia site index data treated as missing values.)

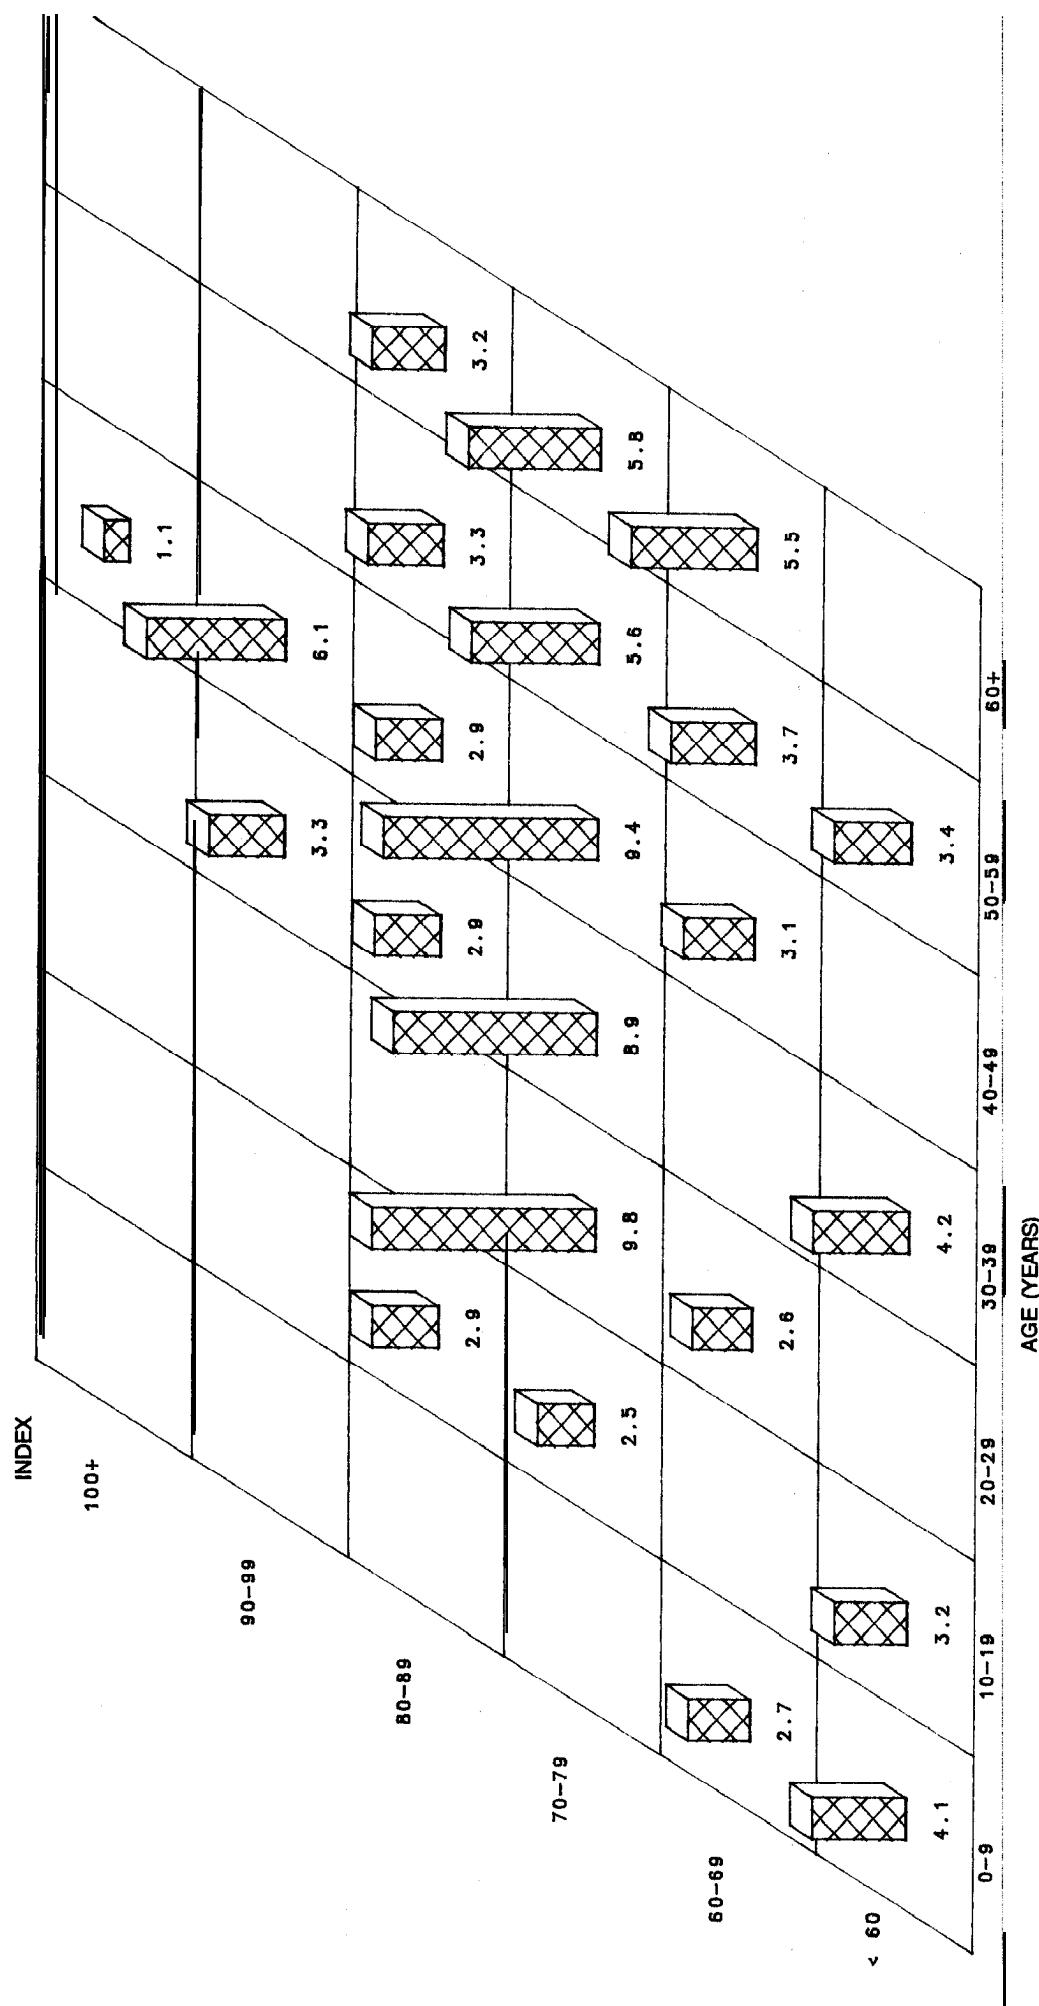

Figure 24A.—Percentage distribution of shortleaf pine stands in the Coastal Plain region of the Southeast, by site index and stand age.
(Represents 109,340 acres of natural stands, and 4,683 acres of planted stands. Georgia site index data treated as missing values.)

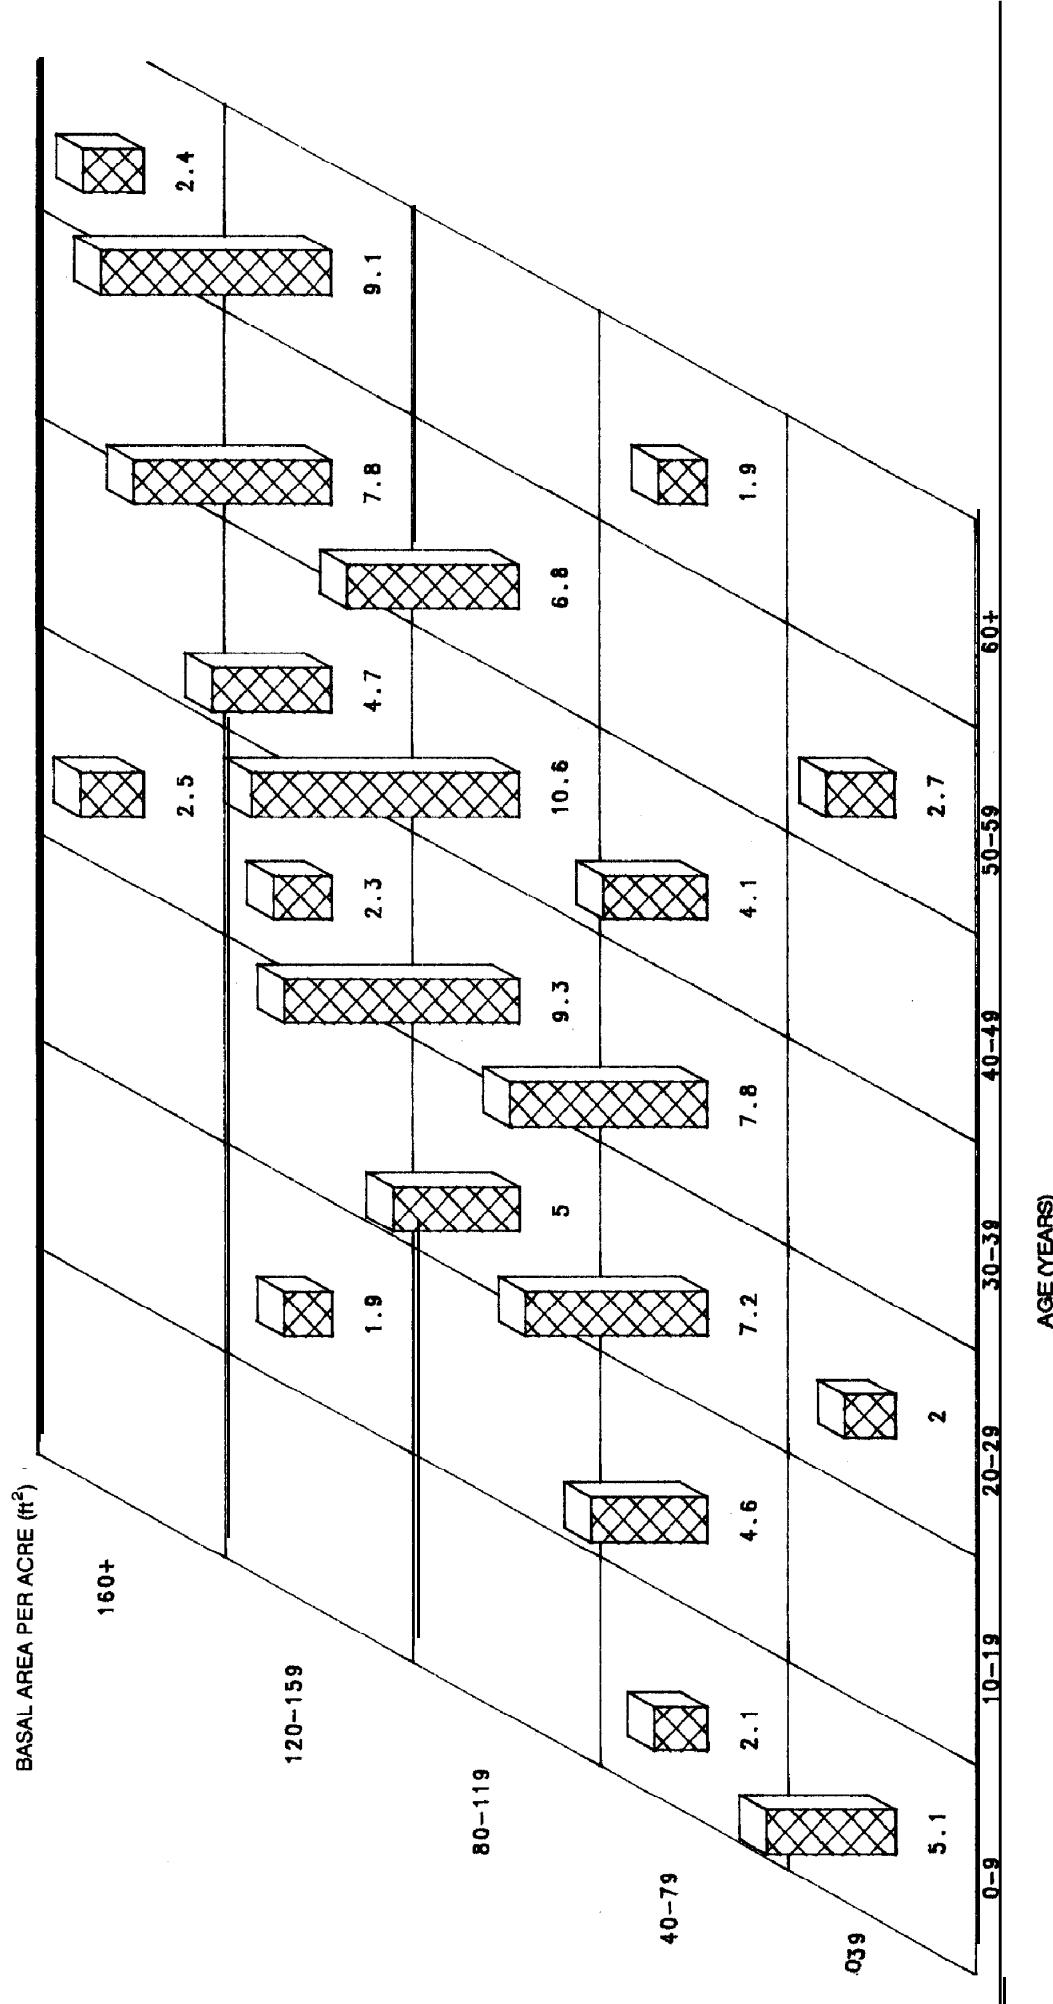

Figure 24B.—Percentage distribution of shortleaf pine stands in the Coastal Plain region of the Southeast, by basal area per acre and stand age.
 (Represents 109,340 acres of natural stands, and 4,683 acres of planted stands.)

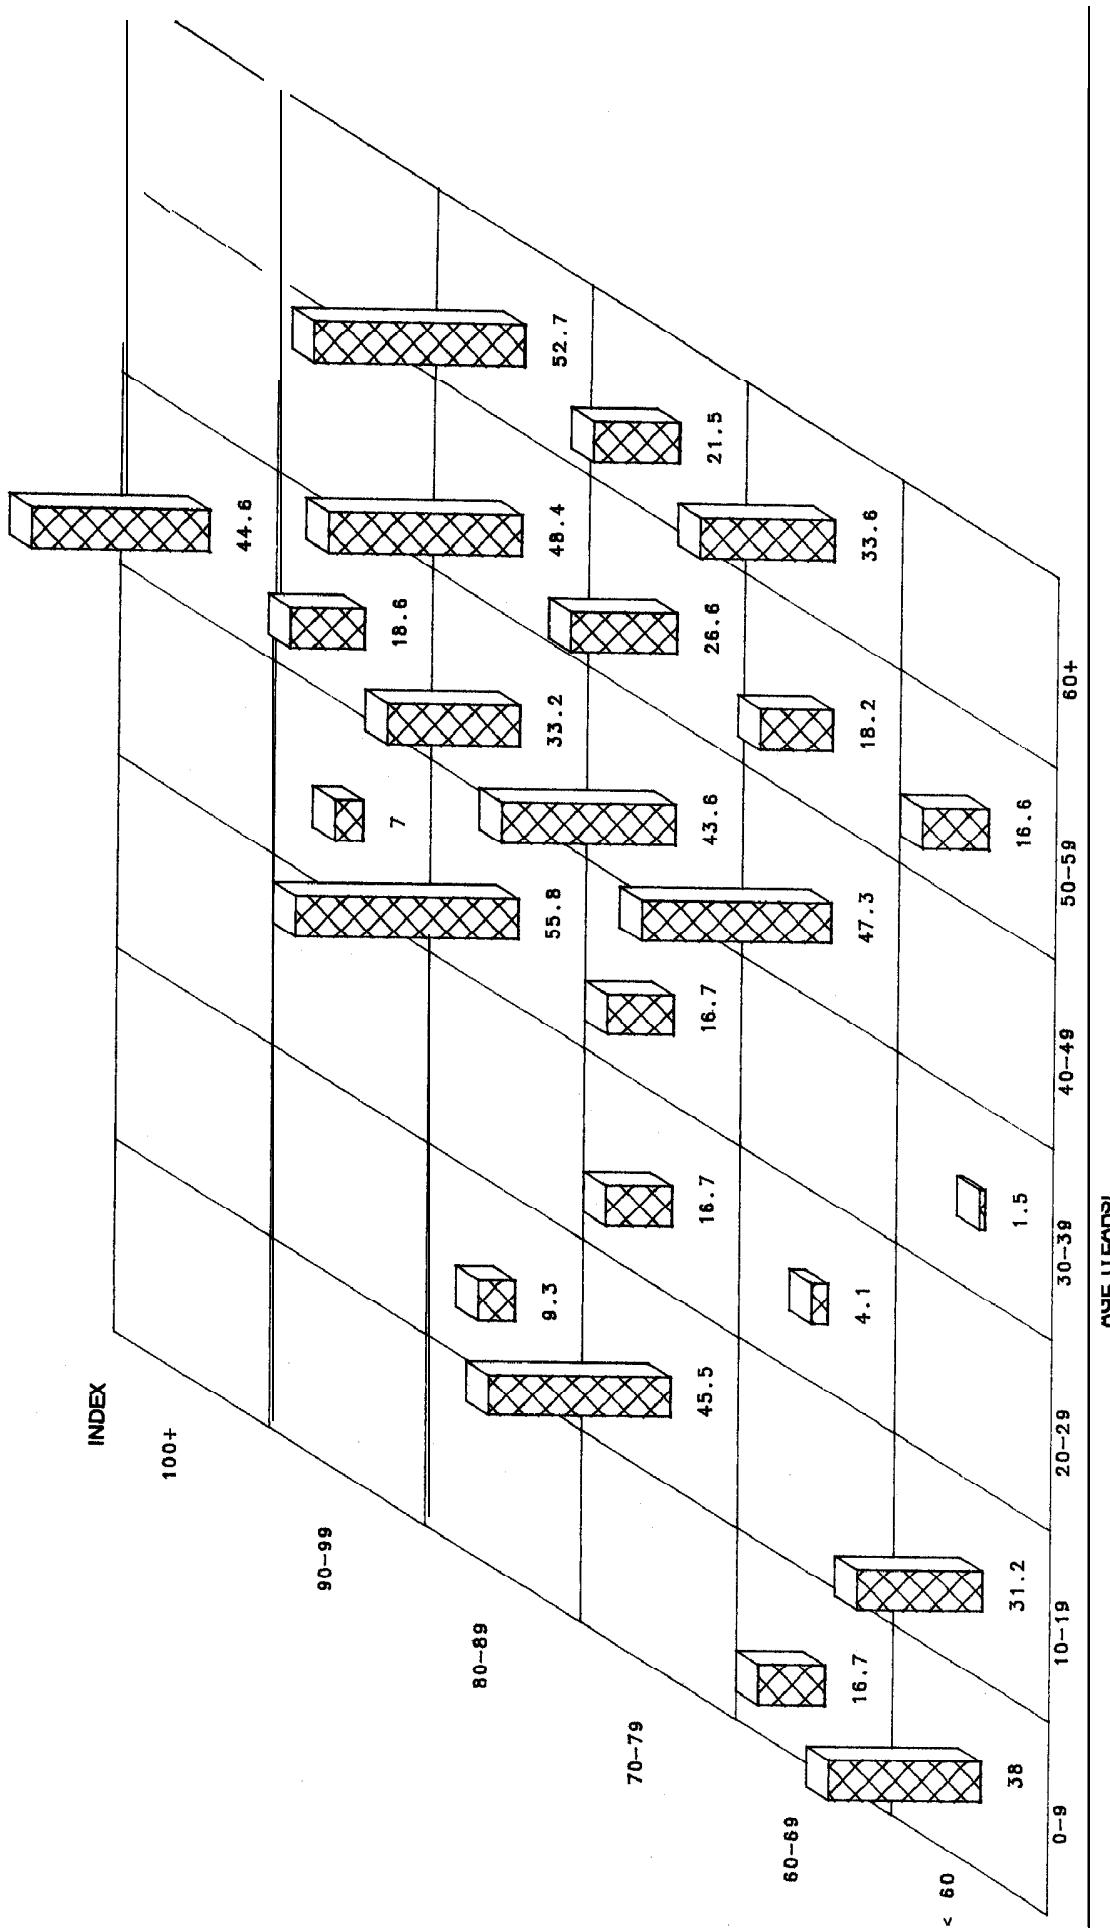

Figure 24C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for shortleaf pine stands in the Coastal Plain region of the Southeast. (Represents 109,340 acres of natural and 4,683 acres of planted stands. Georgia site index data treated as missing values.)

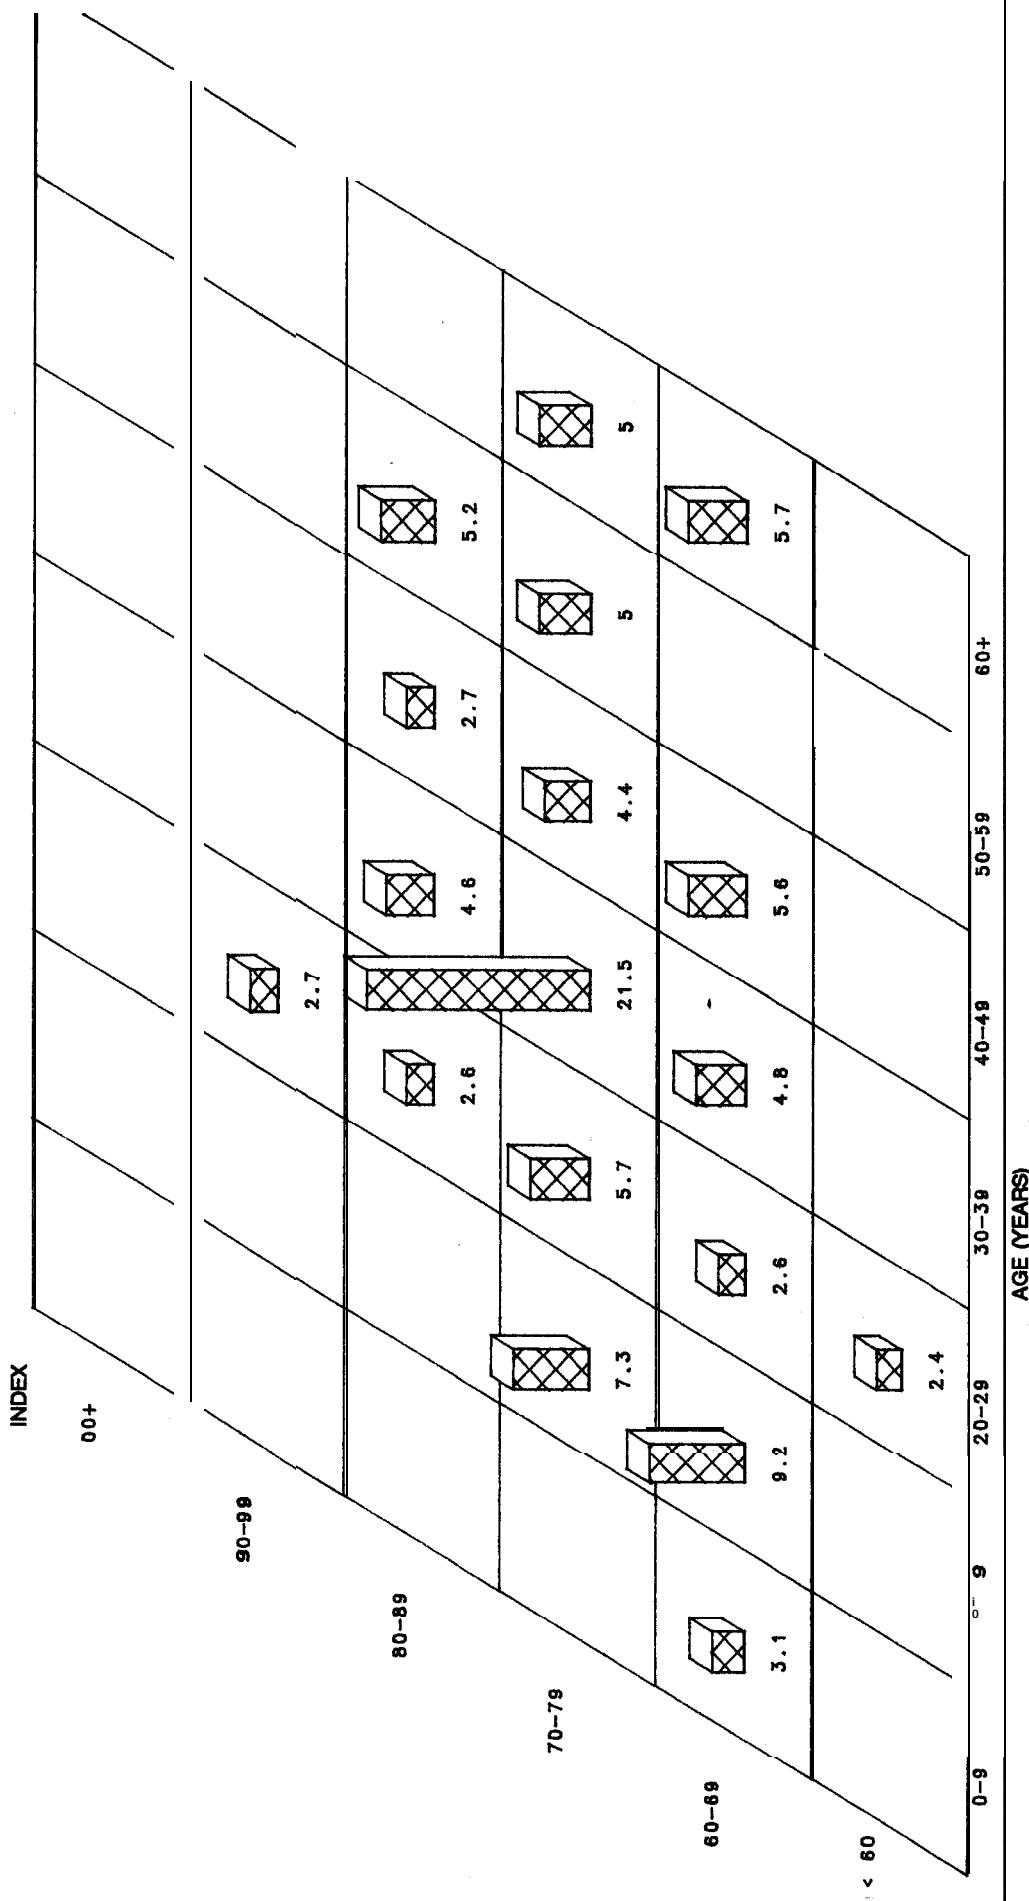

Figure 25A.—Percentage distribution of Virginia pine stands in the Coastal Plain region of the Southeast, by site index and stand age.
(Represents 106,204 acres of natural stands, and 2,724 acres of planted stands. Georgia site index data treated as missing values.)

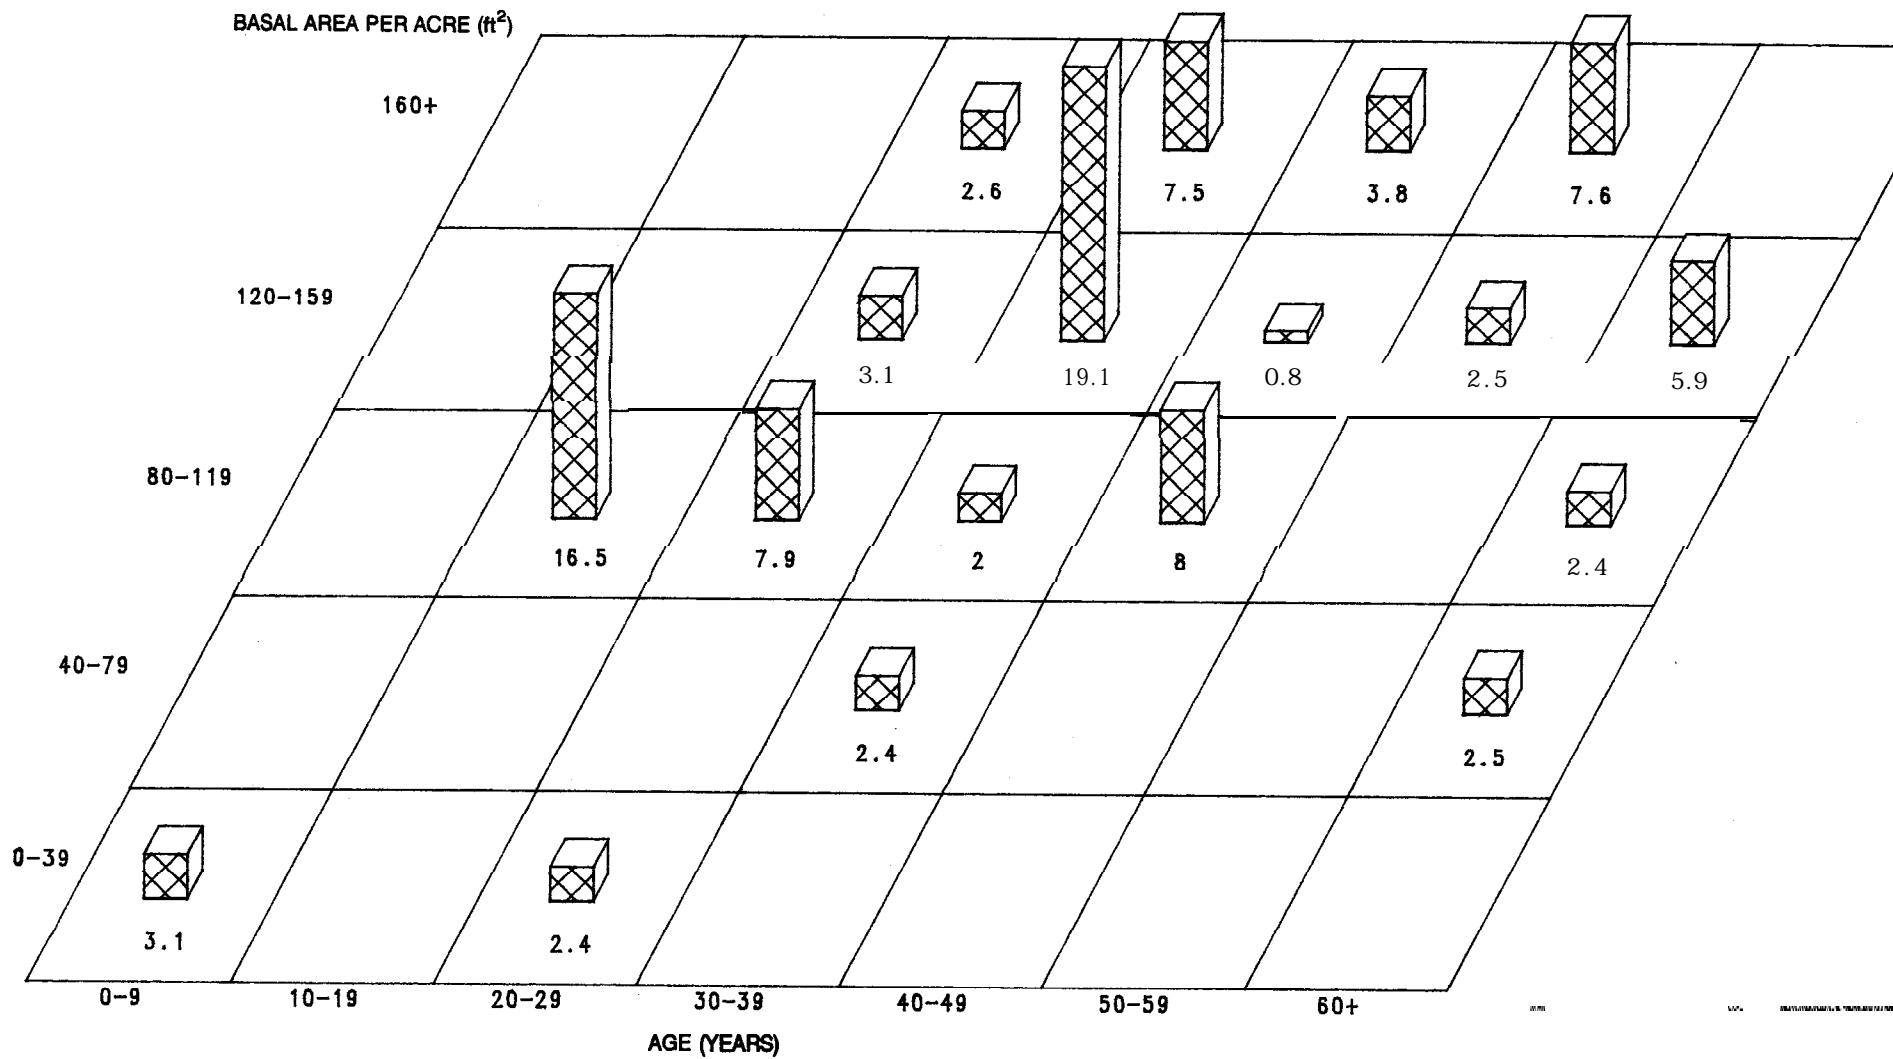

Figure 25B.—Percentage distribution of Virginia pine stands in the Coastal Plain region of the Southeast, by basal area per acre and stand age.
(Represents 106,204 acres of natural stands, and 2,724 acres of planted stands.)

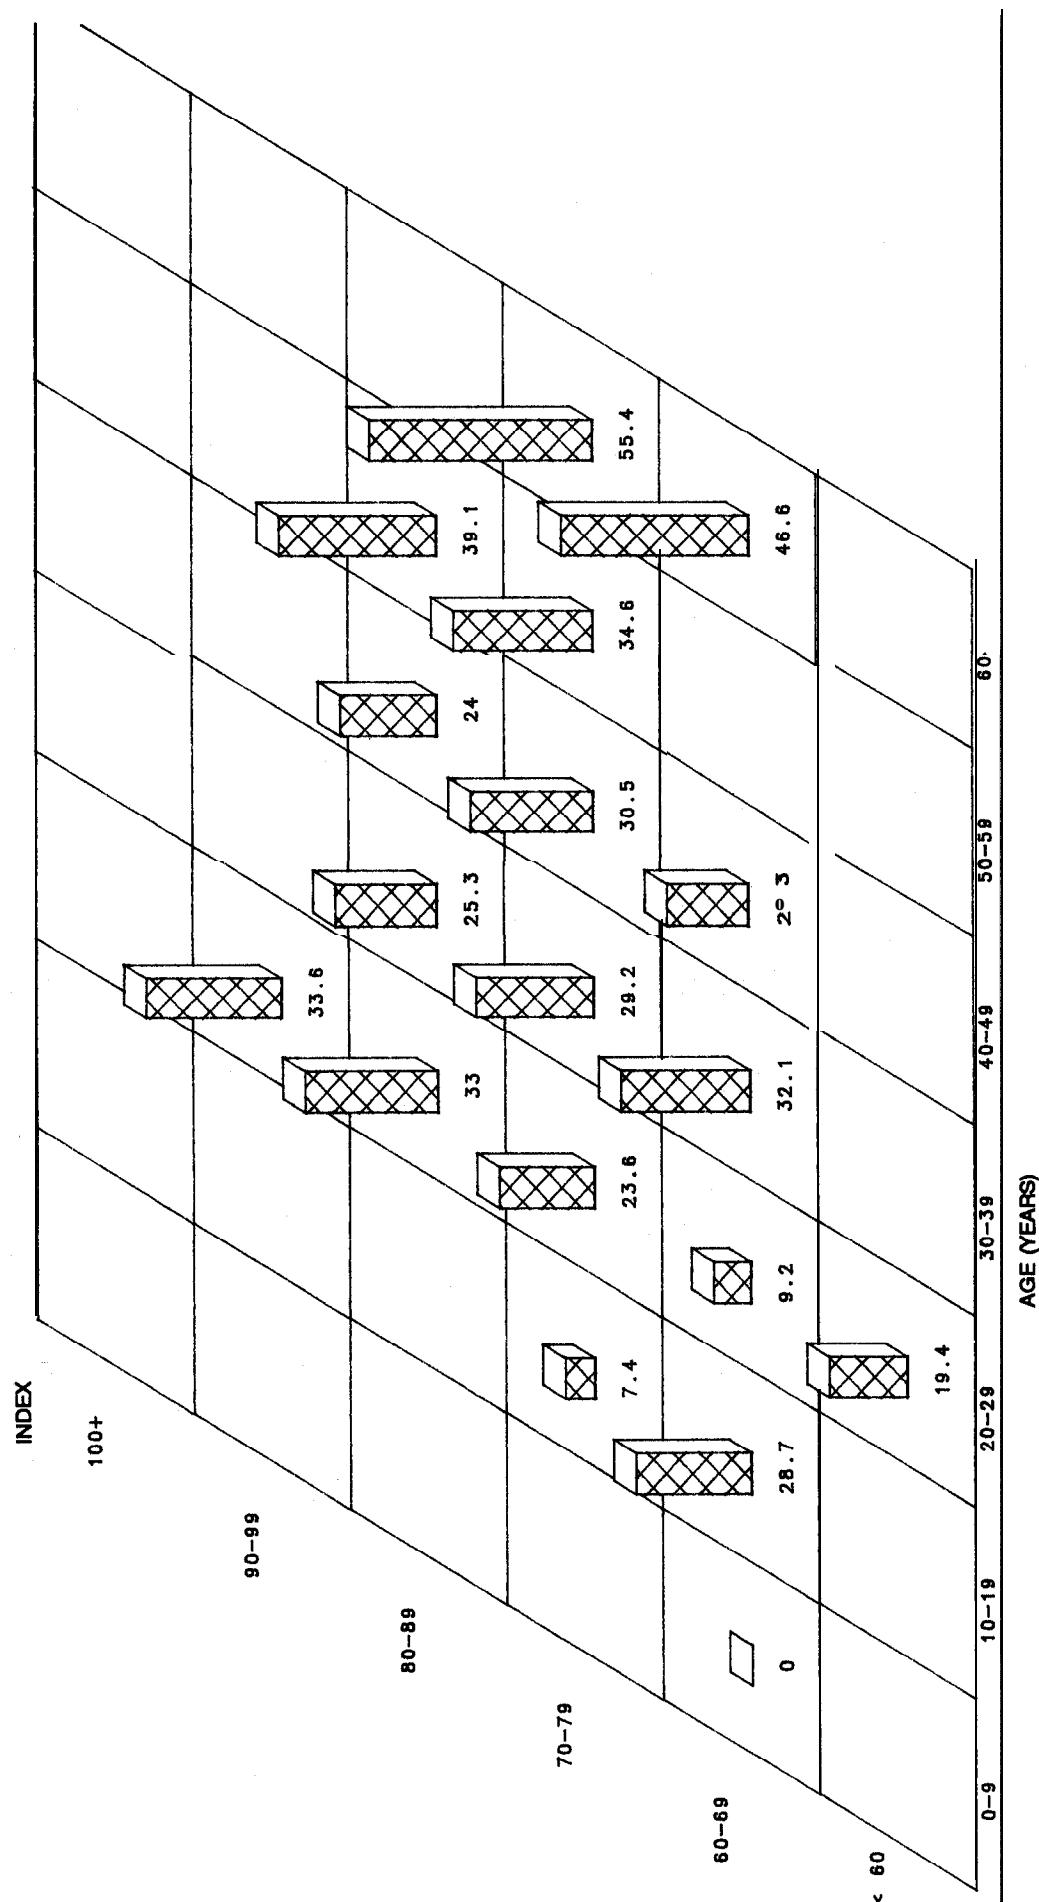

Figure 25C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for Virginia pine stands in the Coastal Plain region of the Southeast. (Represents 106,204 acres of natural stands, and 2,724 acres of planted stands. Georgia site index data treated as missing values.)

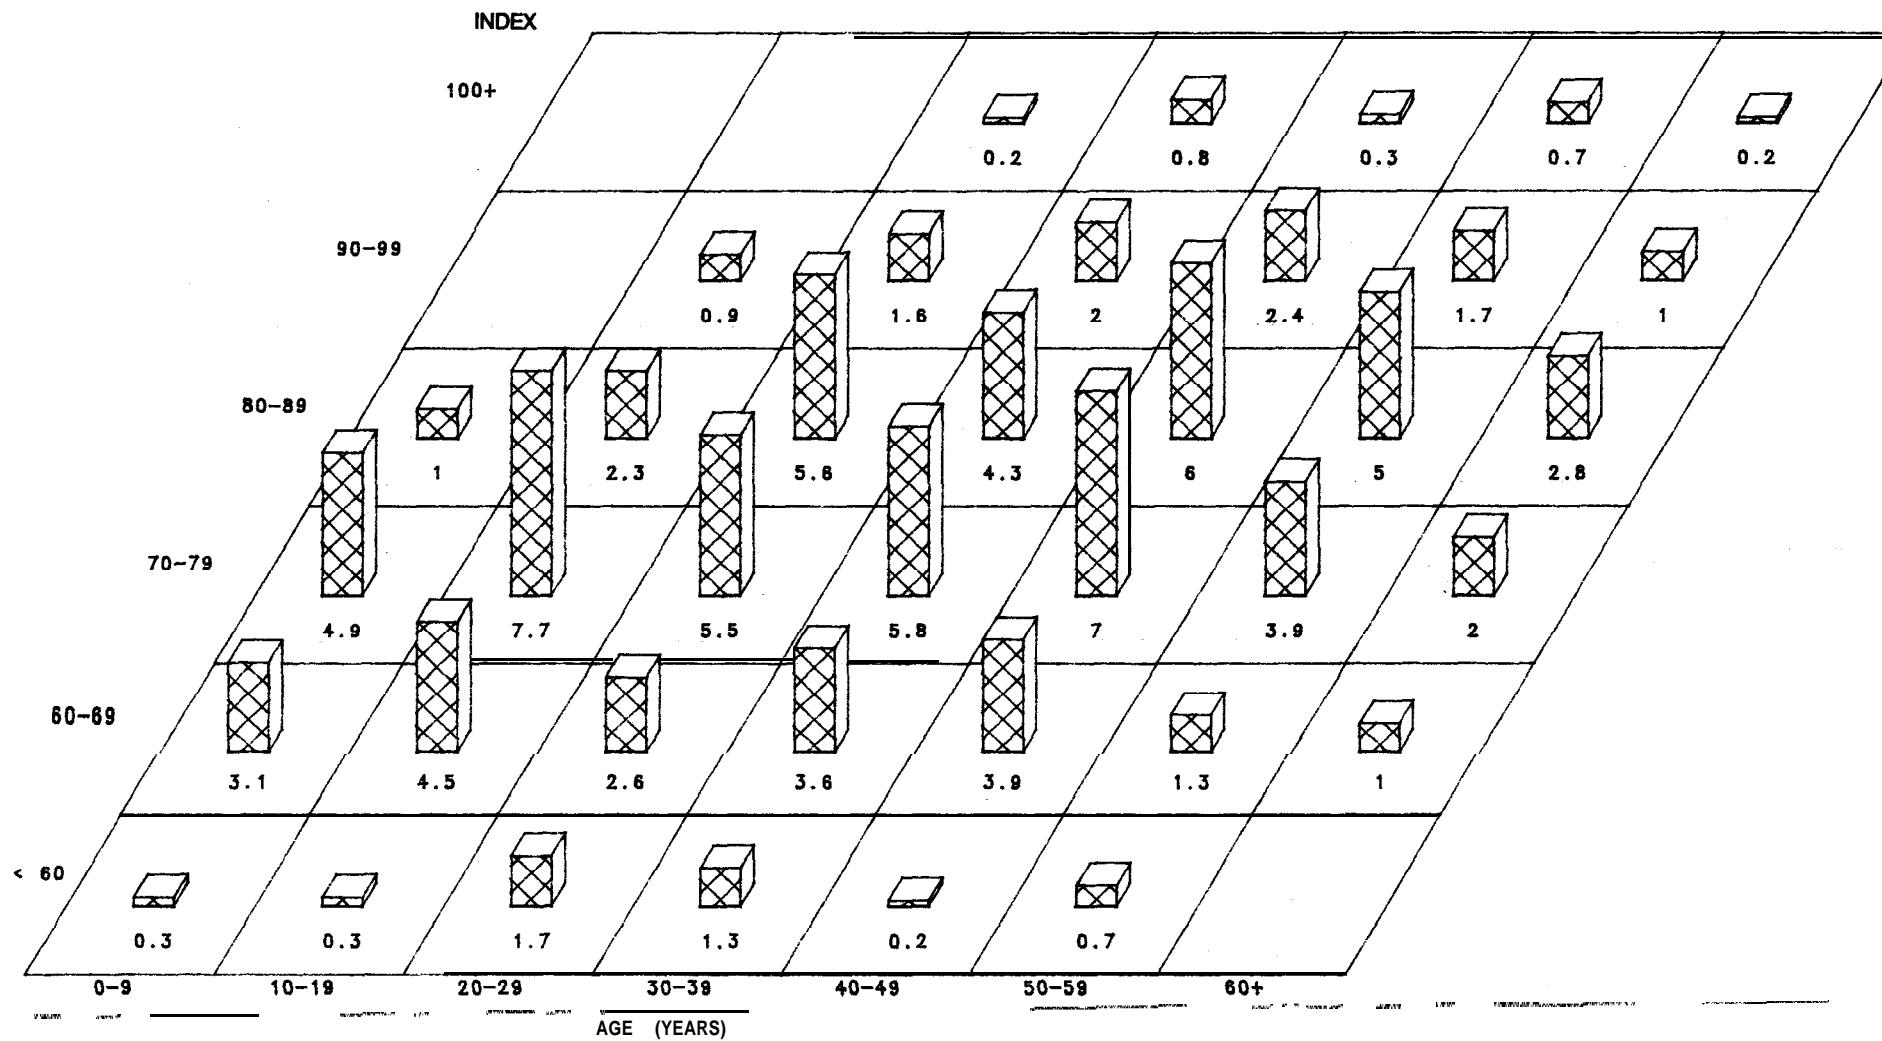

Figure 26A.—Percentage distribution of natural loblolly pine stands in the Piedmont region of the Southeast, by site index and stand age.
(Represents 4,449,074 acres. Georgia site index data treated as missing values.)

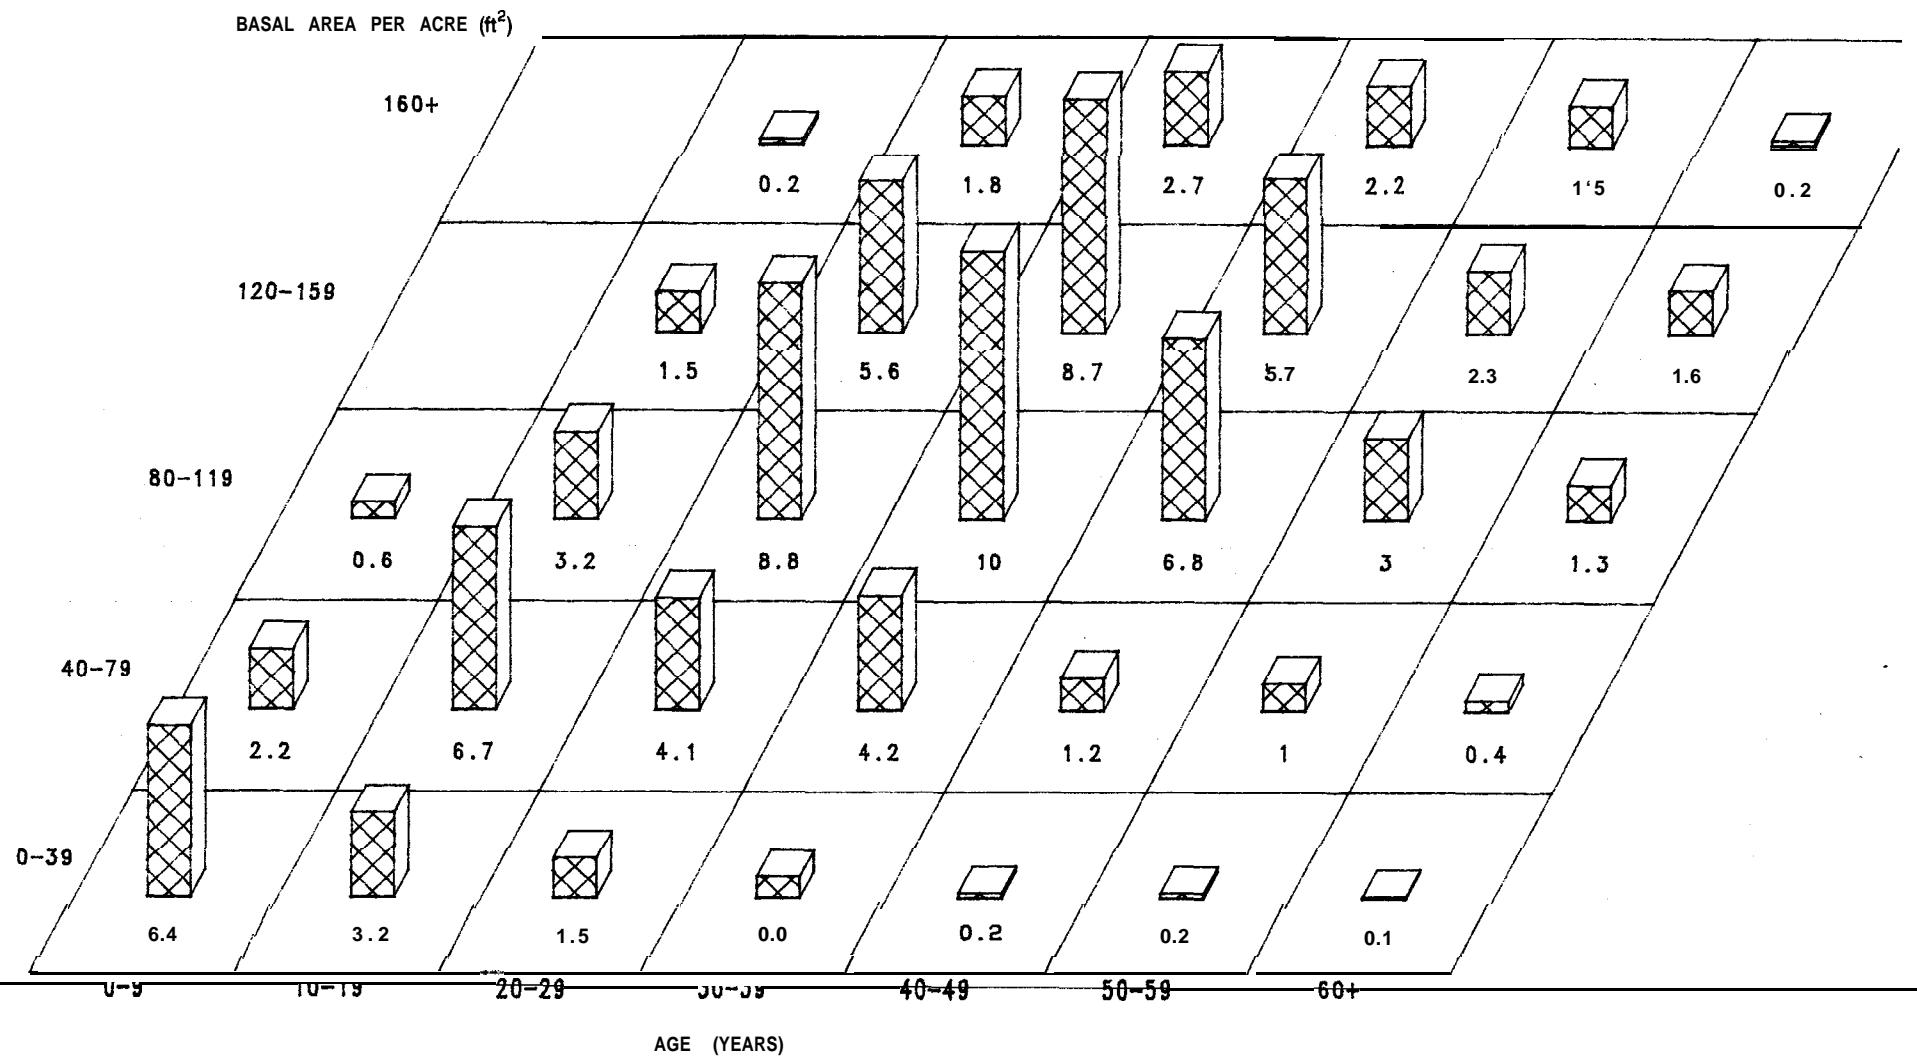

Figure 26B.—Percentage distribution of natural loblolly pine stands in the Piedmont region of the Southeast, by basal area per acre and stand age. (Represents 4,449,074 acres.)

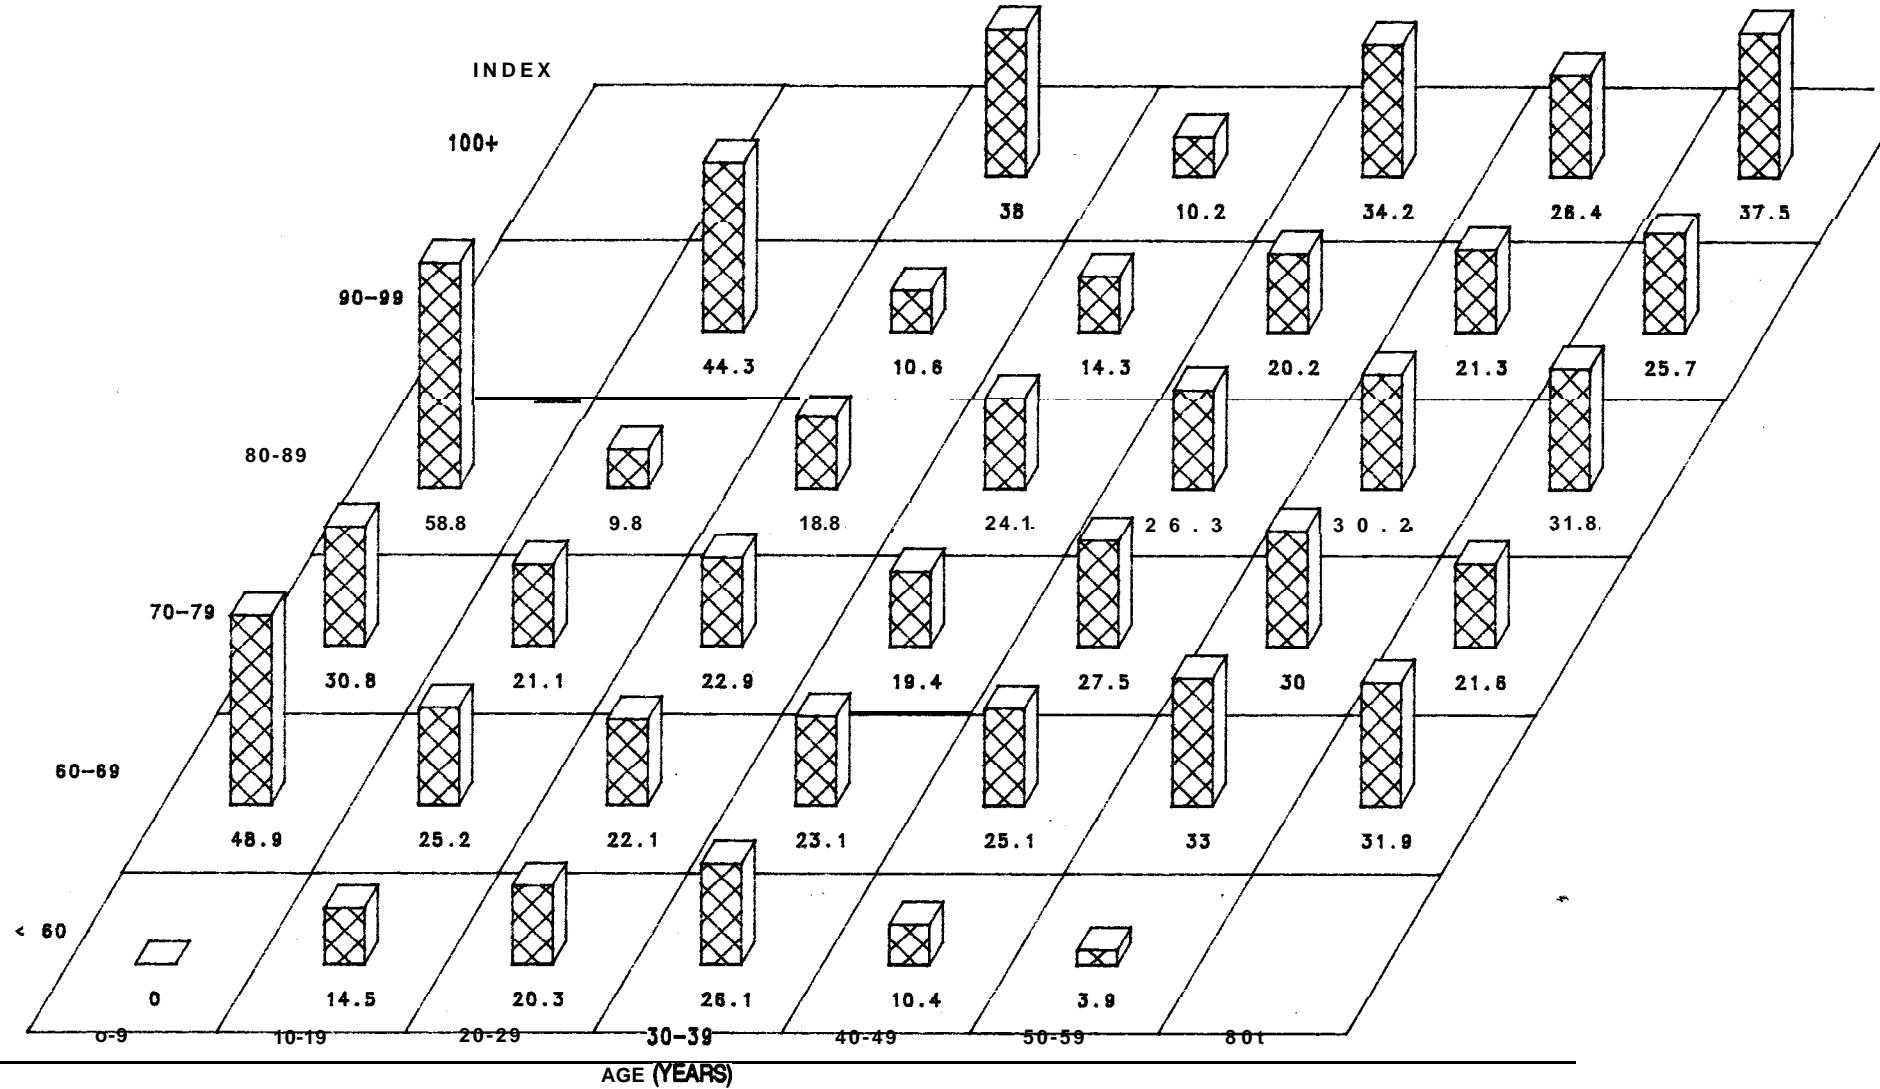

Figure 26C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for natural pine stands in the Piedmont region of the Southeast (Represents 4,449,074 acres. Georgia site index data treated as missing values.)

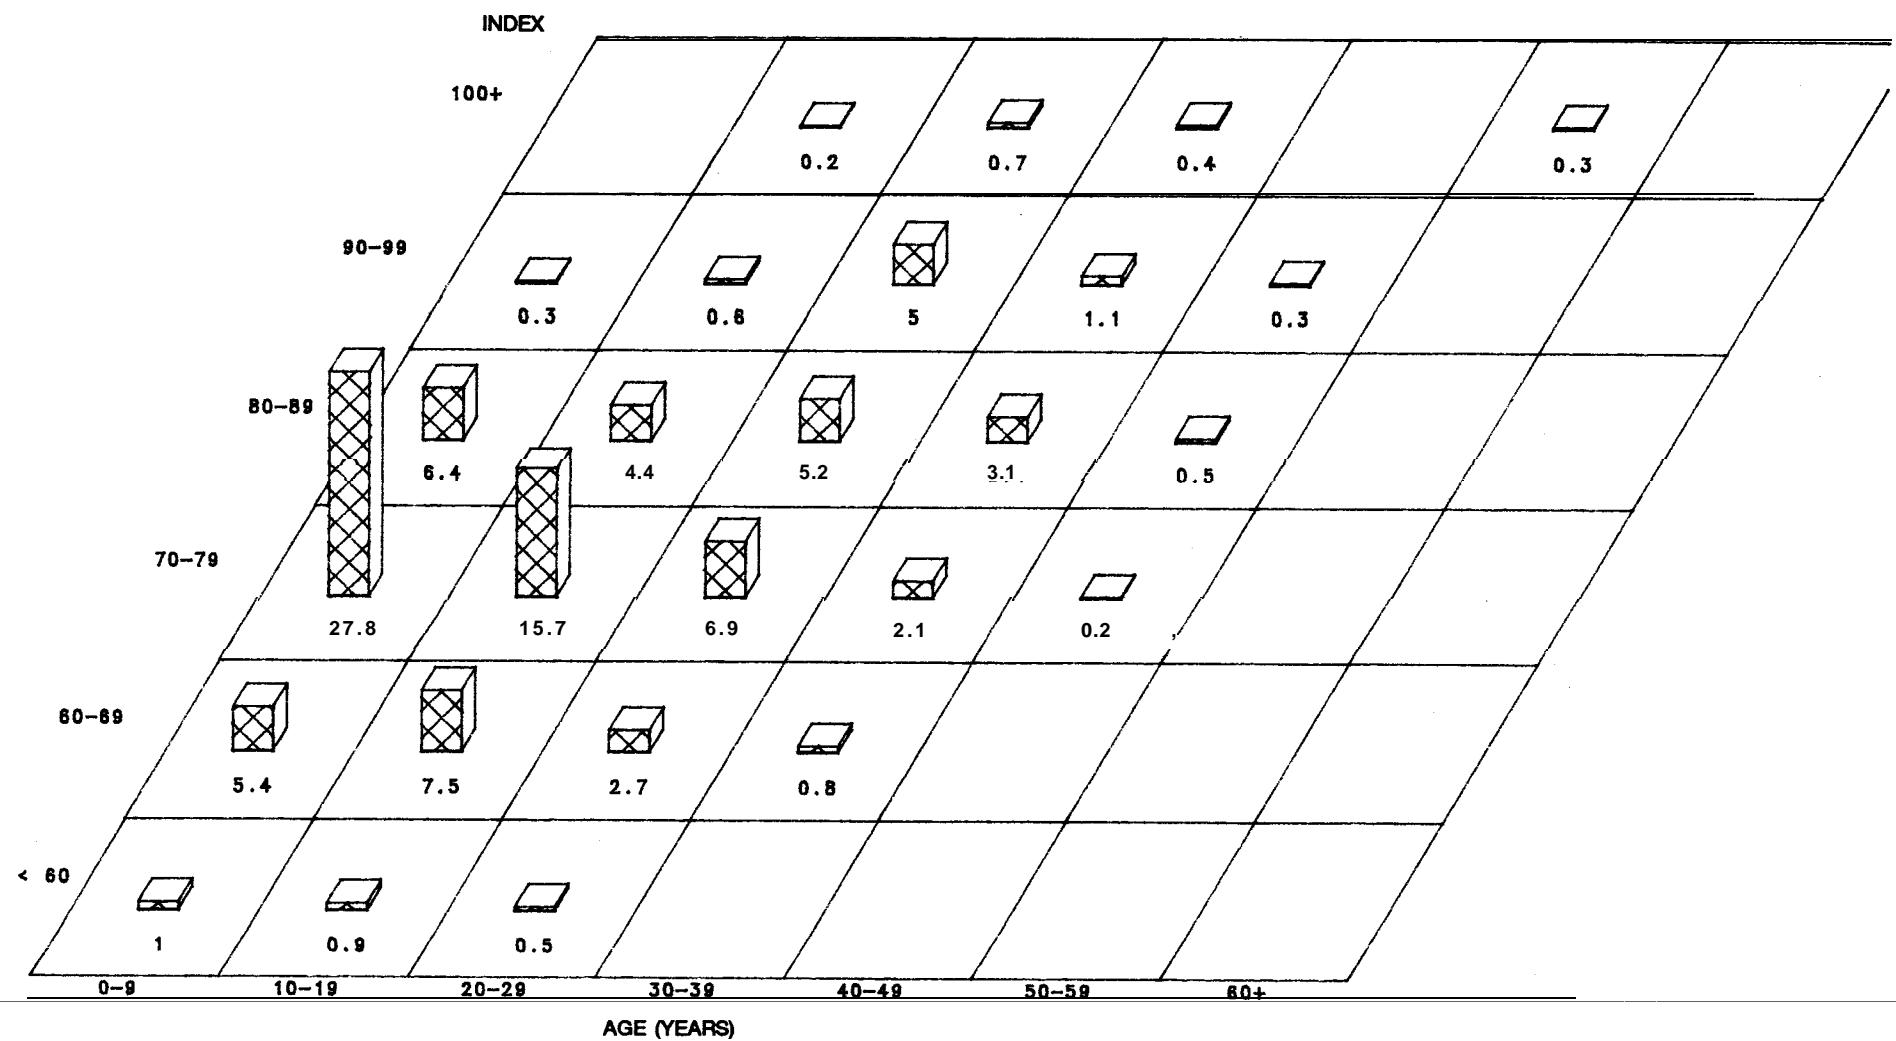

Figure 27A.—Percentage distribution of planted loblolly pine stands in the Piedmont region of the Southeast, by site index and stand age.
(Represents 2,403,540 acres. Georgia site index data treated as missing values.)

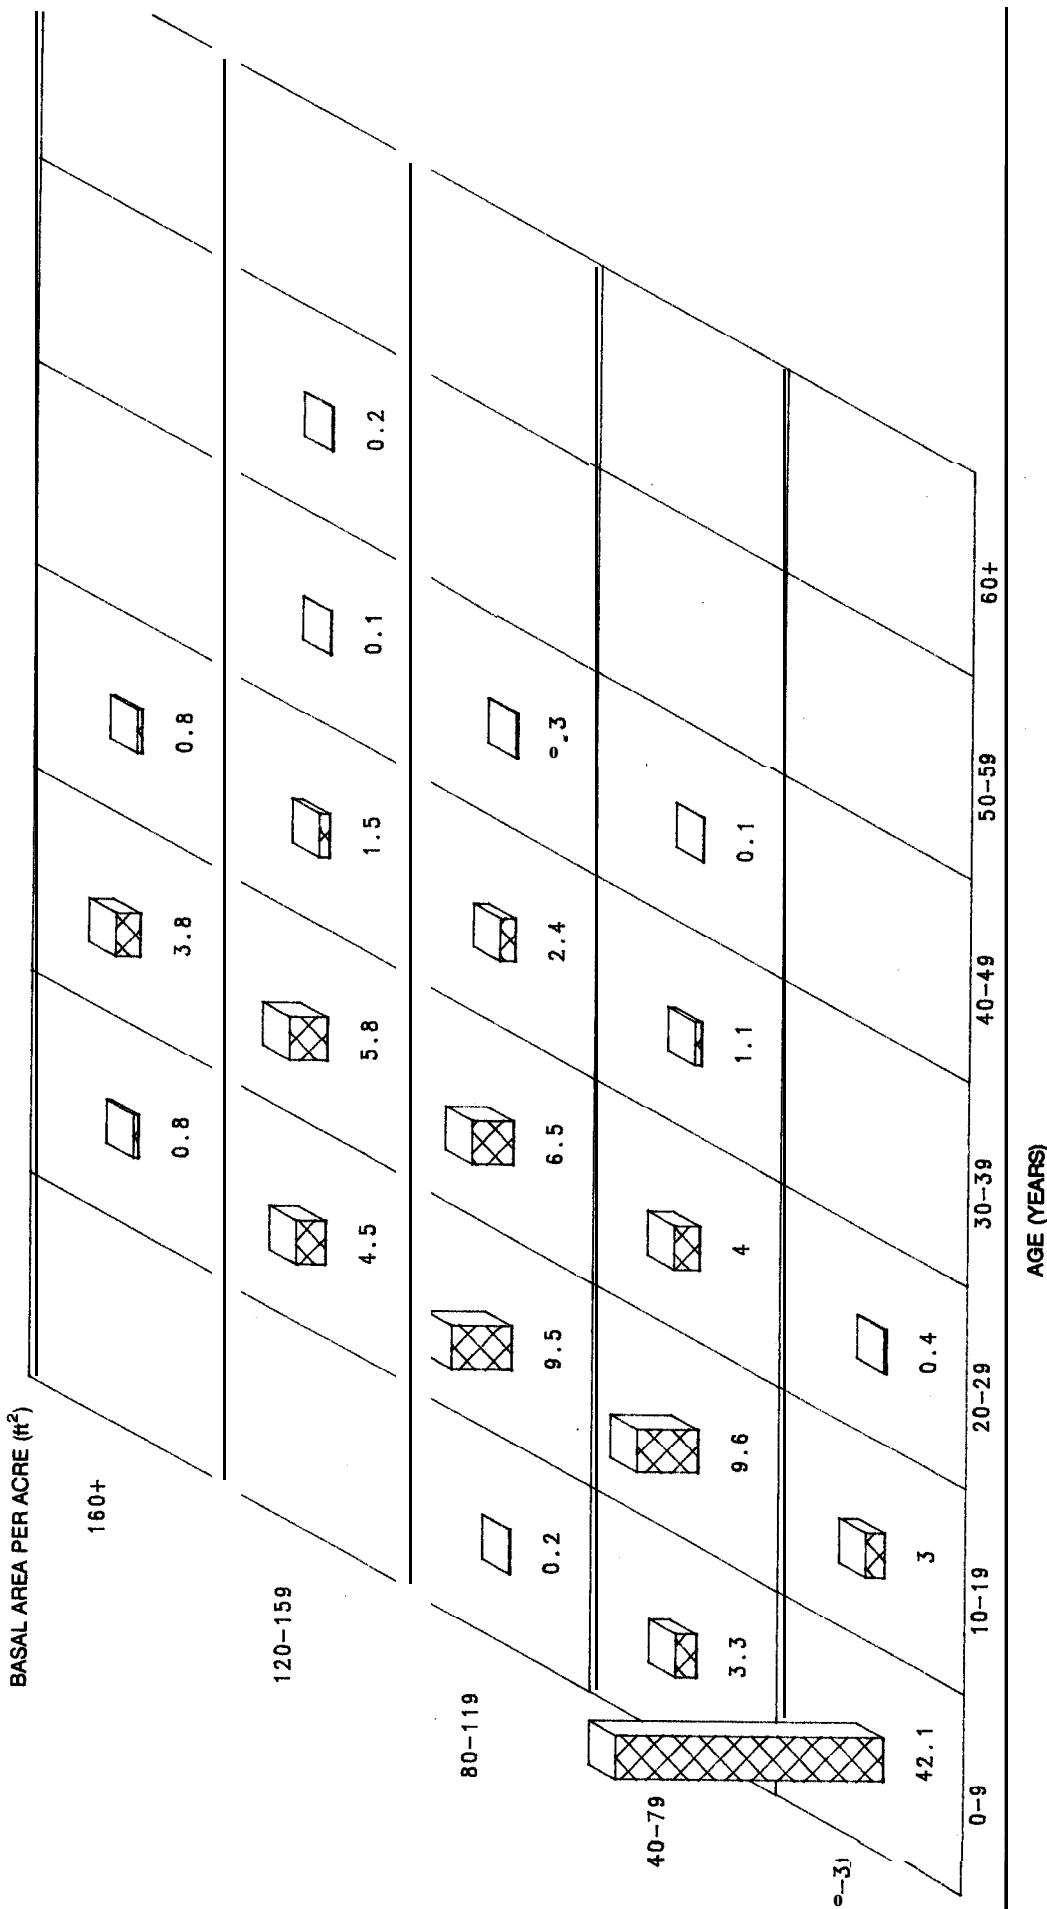

Figure 27B.—Percentage distribution of planted loblolly pine stands in the Piedmont region of the Southeast, by basal area per acre and stand age. (Represents 2,403,540 acres.)

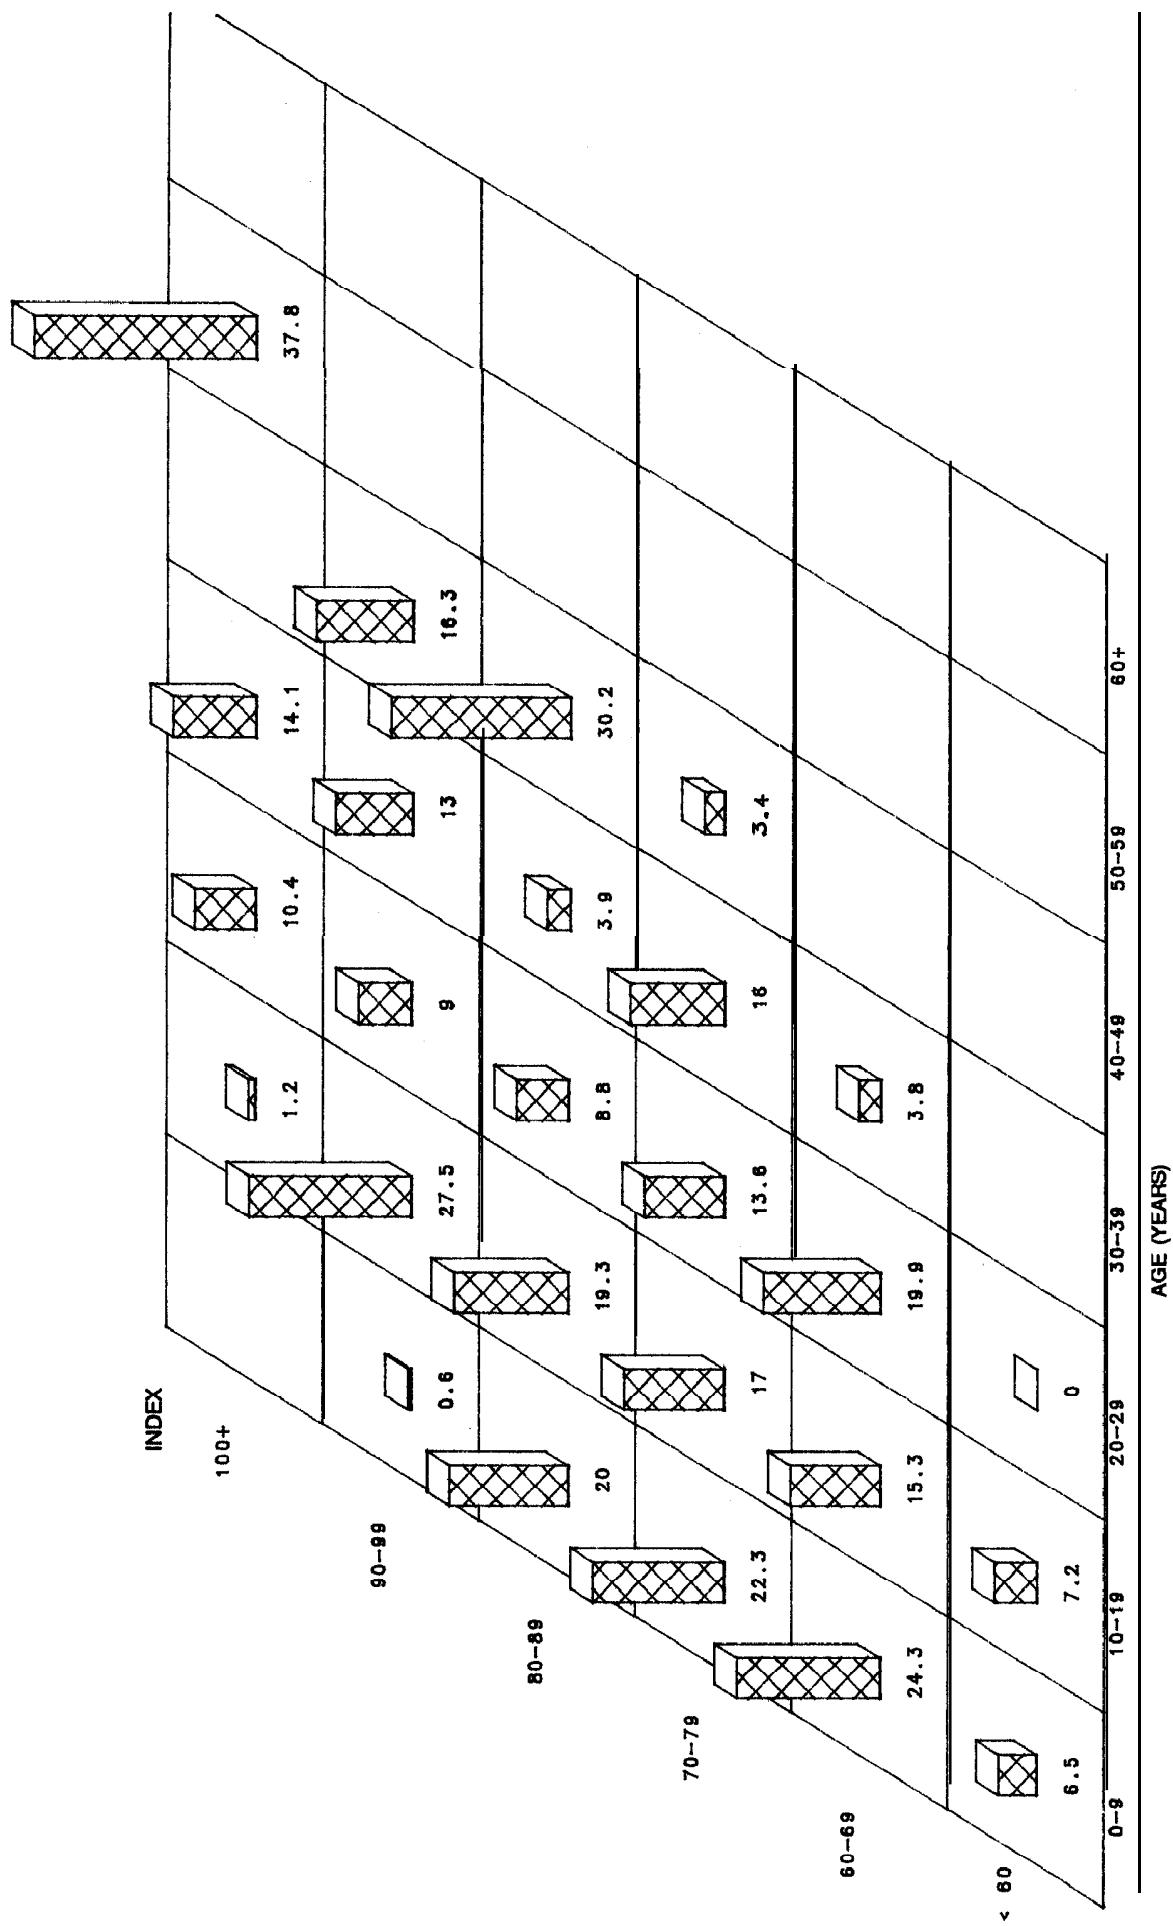

Figure 27C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for planted loblolly pine stands in the Piedmont region of the Southeast. (Represents 2,403,540 acres. Georgia site index data treated as missing values.)

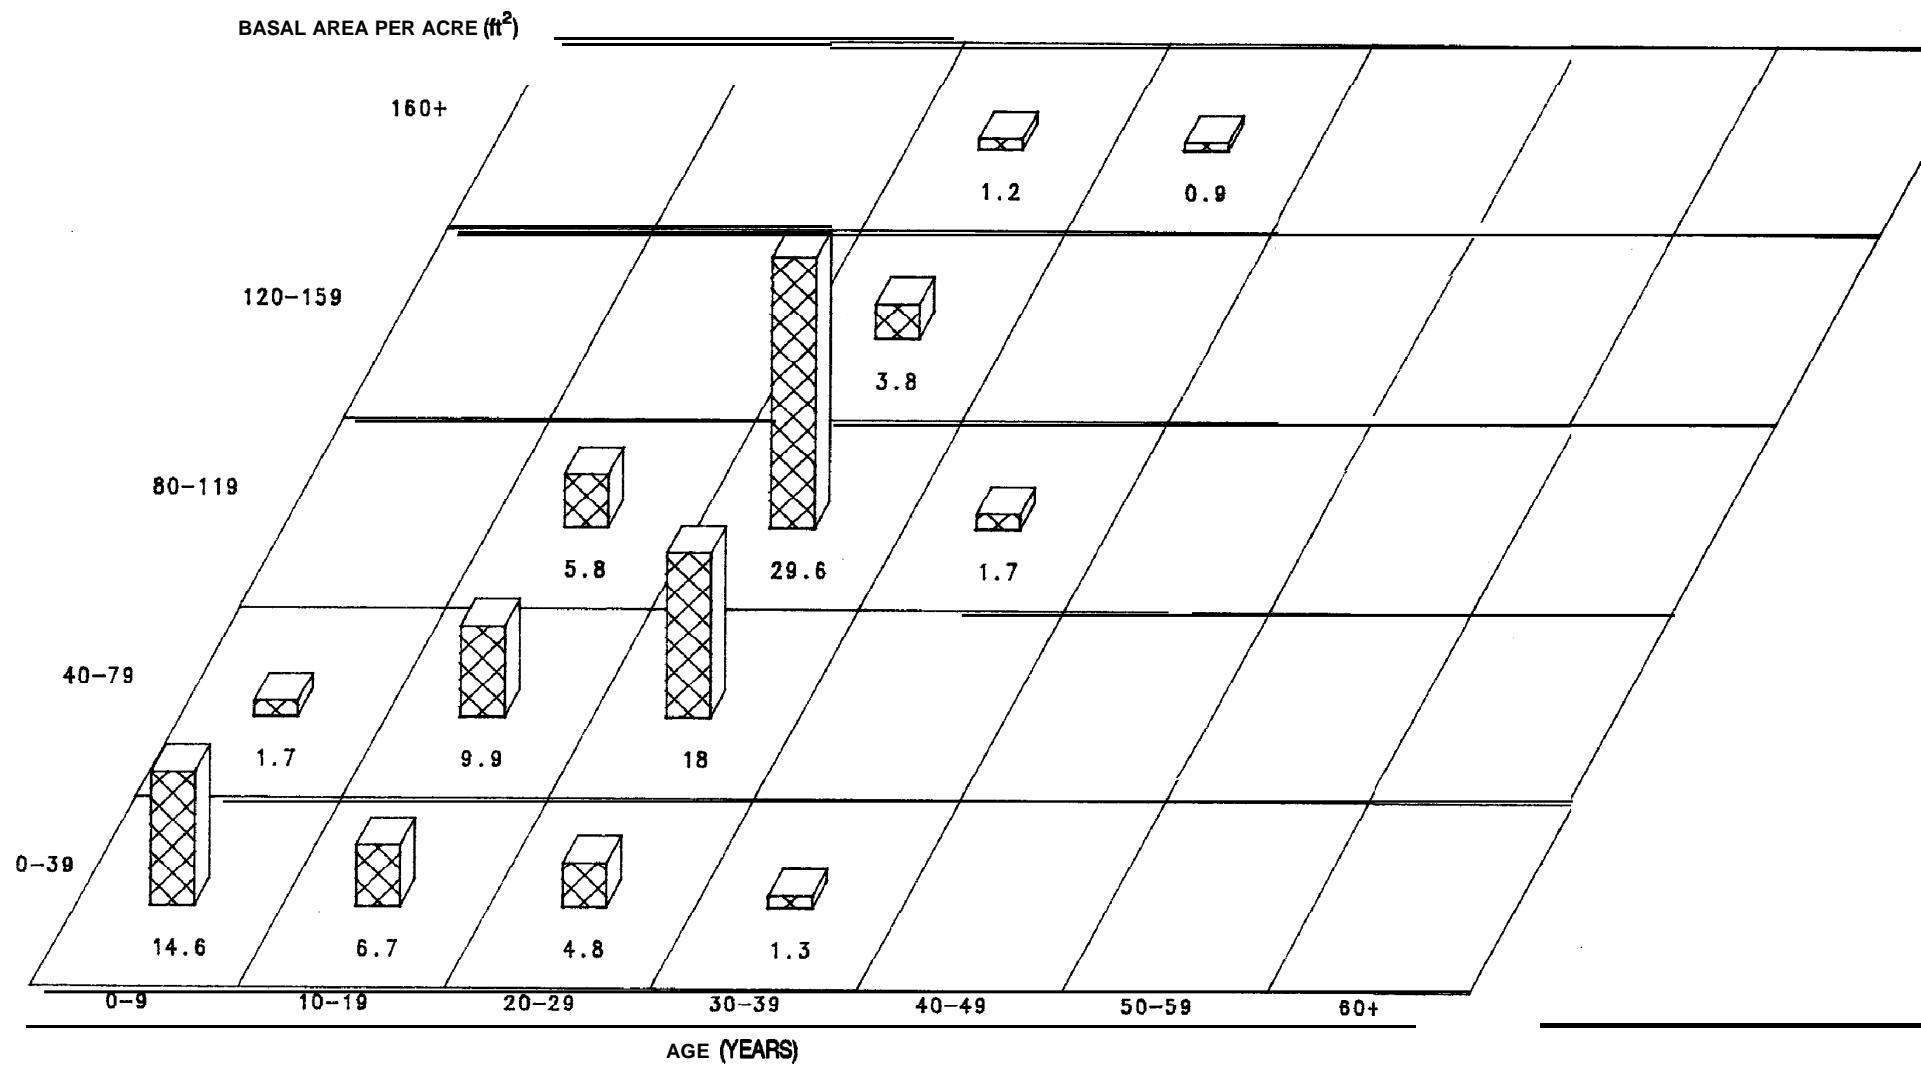

Figure 28.—Percentage distribution of planted slash pine stands in the Piedmont region of the Southeast, by basal area per acre and stand age. (Represents 337,408 acres. Entire sample located in Georgia.)

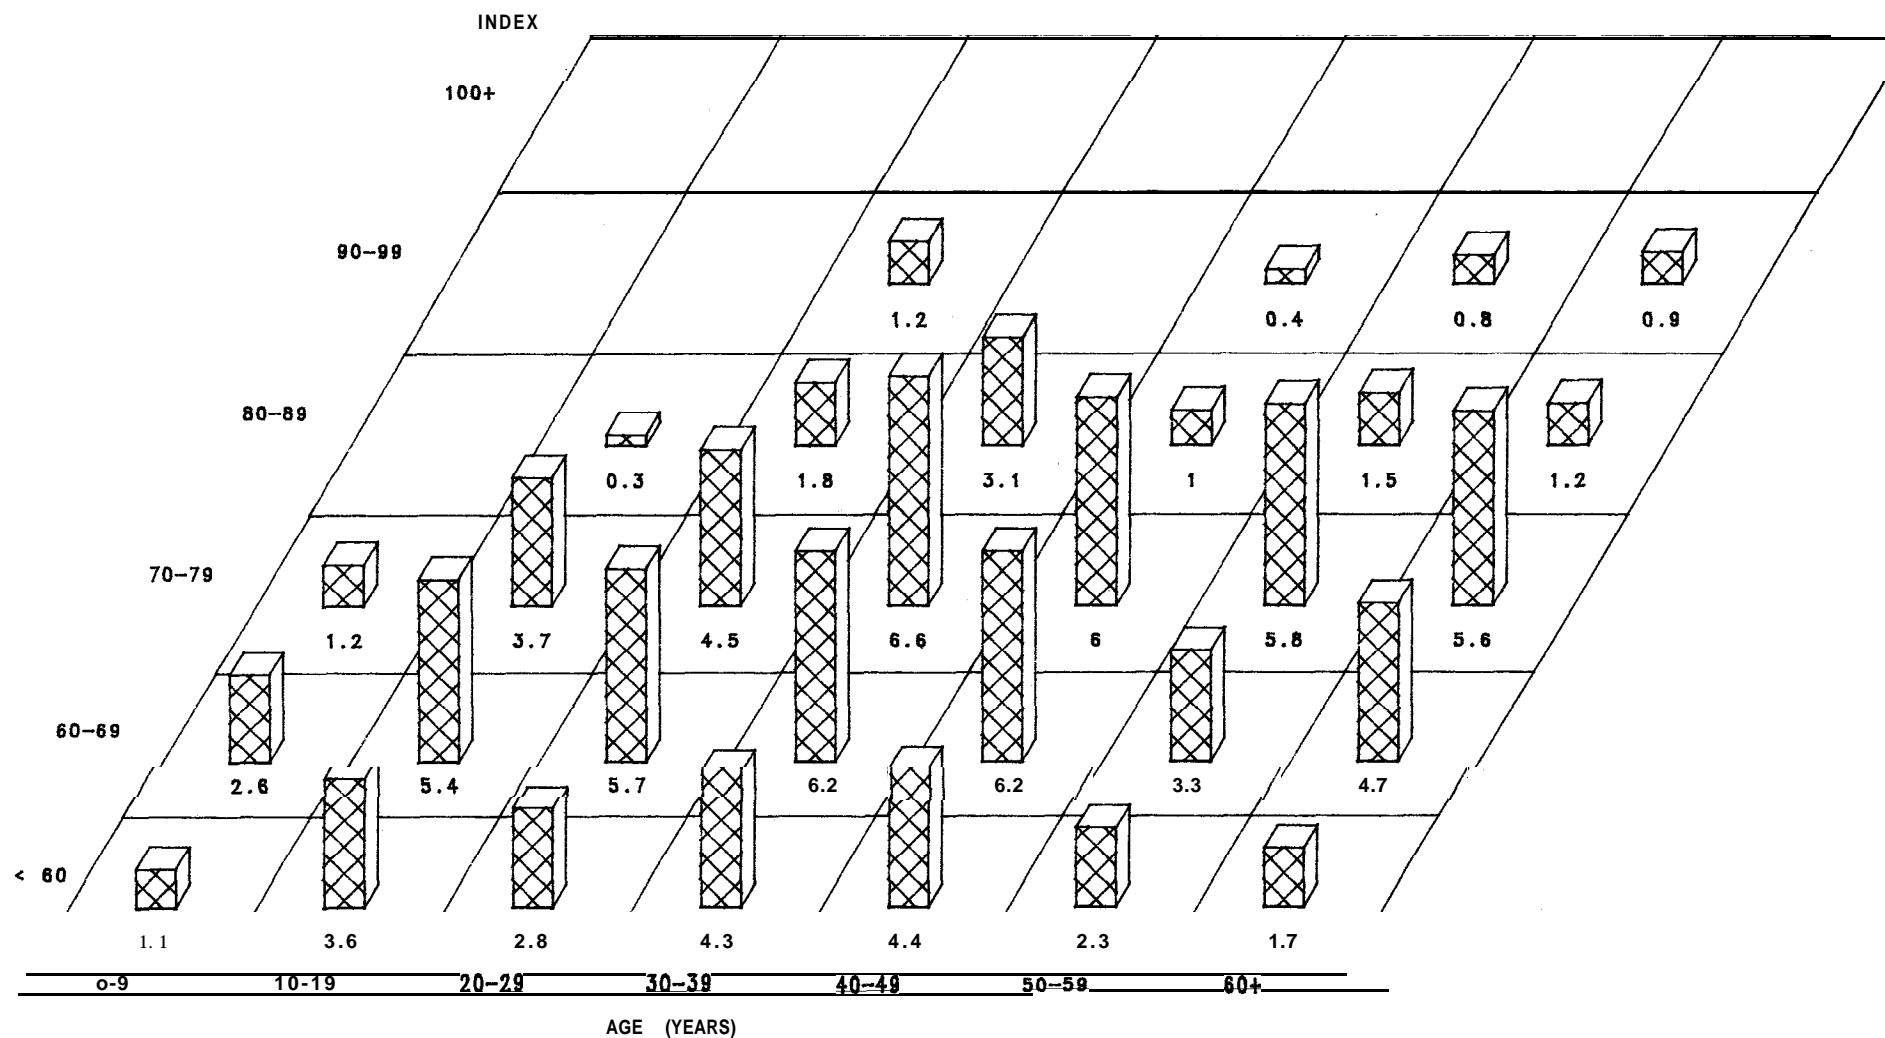

Figure 29A.—Percentage distribution of shortleaf pine stands in the Piedmont region of the Southeast, by site index and stand age.
(Represents 1,522,226 acres of natural stands, and 12,290 acres of planted stands. Georgia site index data treated as missing values.)

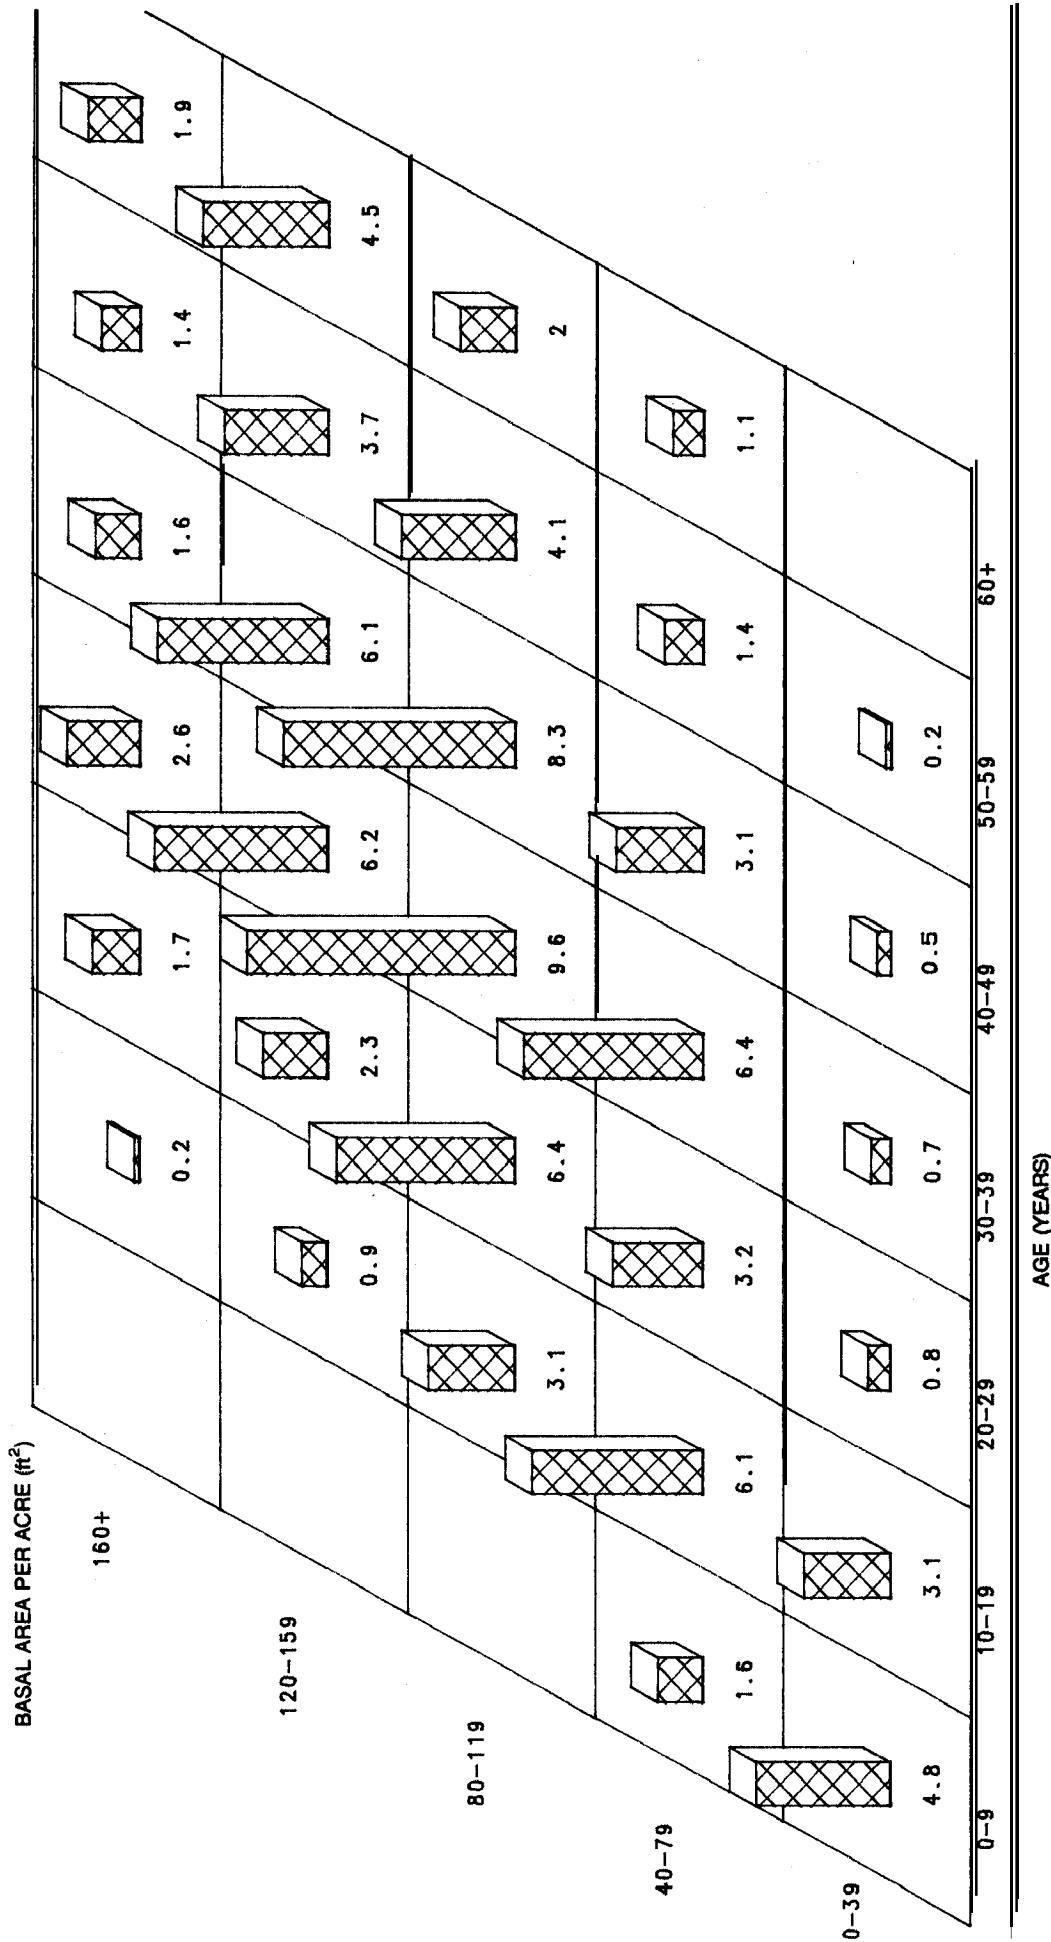

Figure 29B.—Percentage distribution of shortleaf pine stands in the Piedmont region of the Southeast, by basal area per acre and stand age.
(Represents 1,522,226 acres of natural stands, and 12,290 acres of planted stands.)

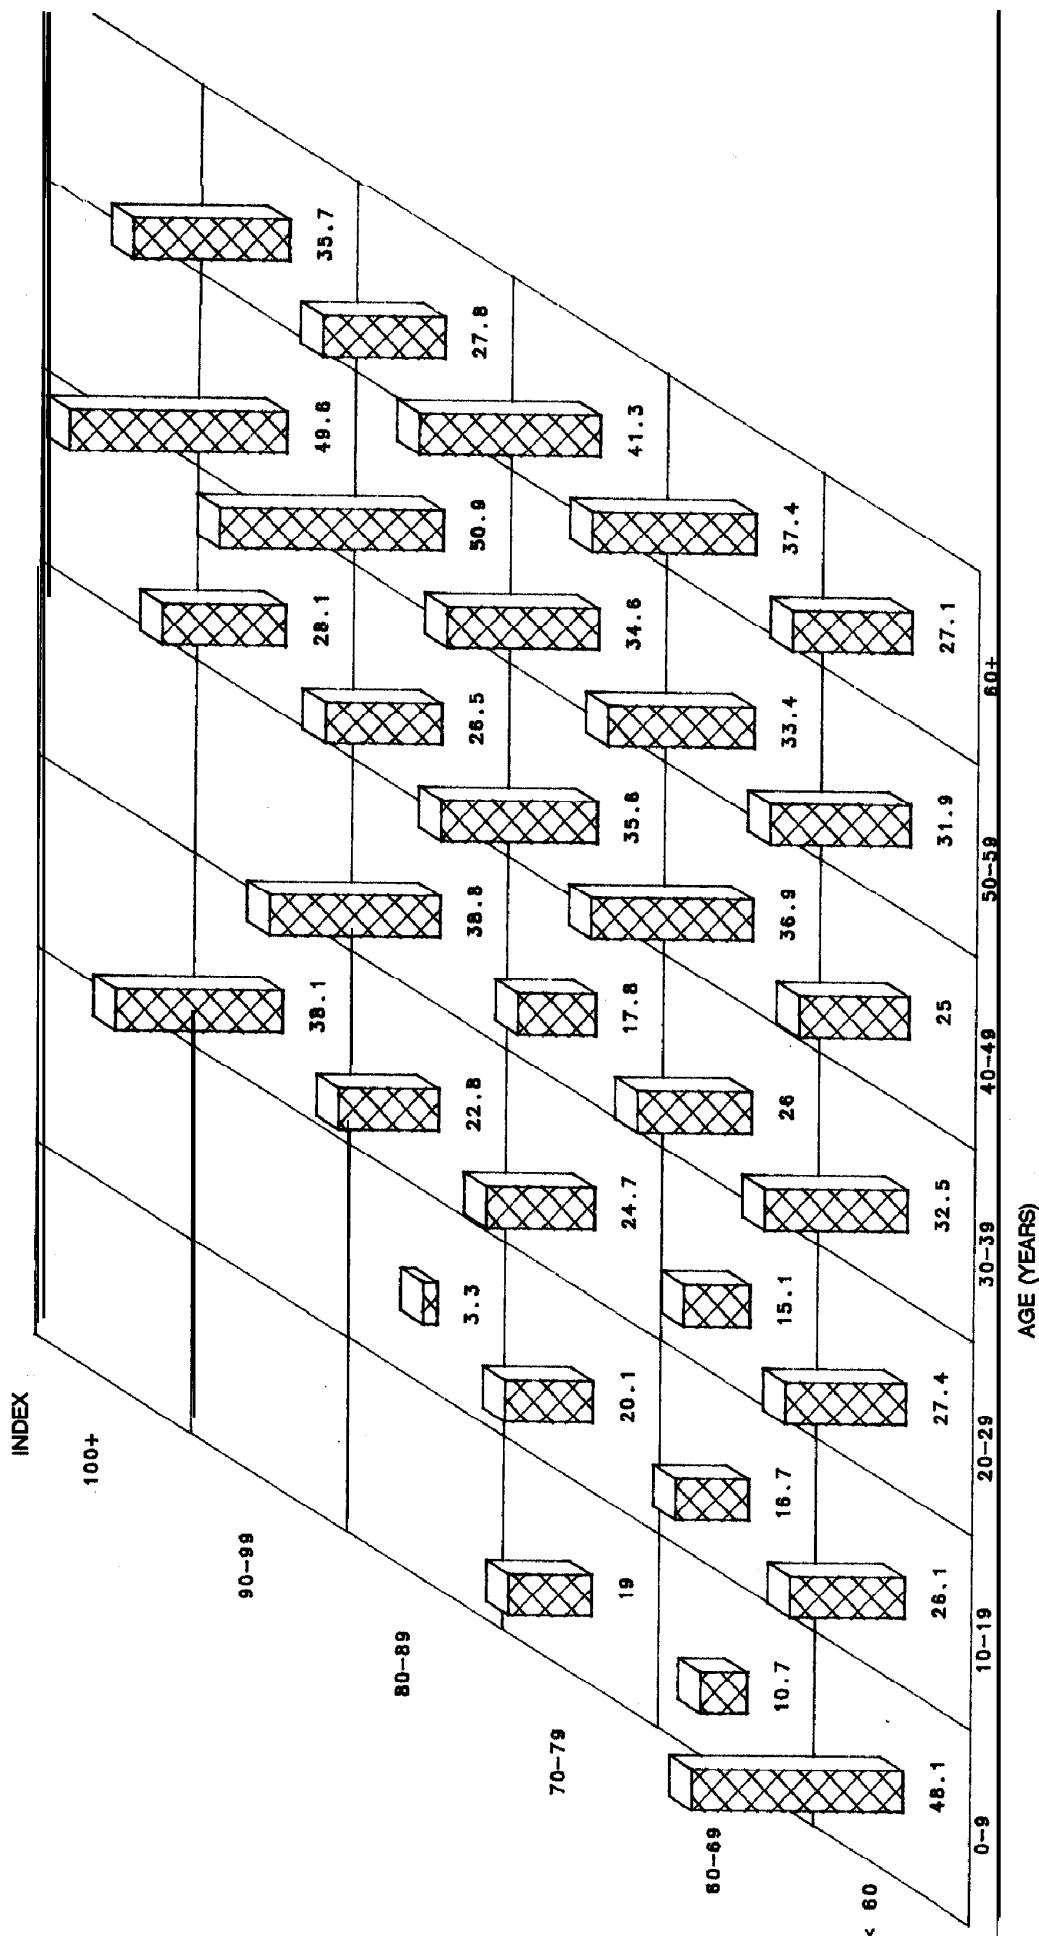

Figure 29C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for shortleaf pine stands in the Piedmont region of the Southeast. (Represents 1,522,226 acres of natural stands, and 12,290 acres of planted stands. Georgia site index data treated as missing values.)

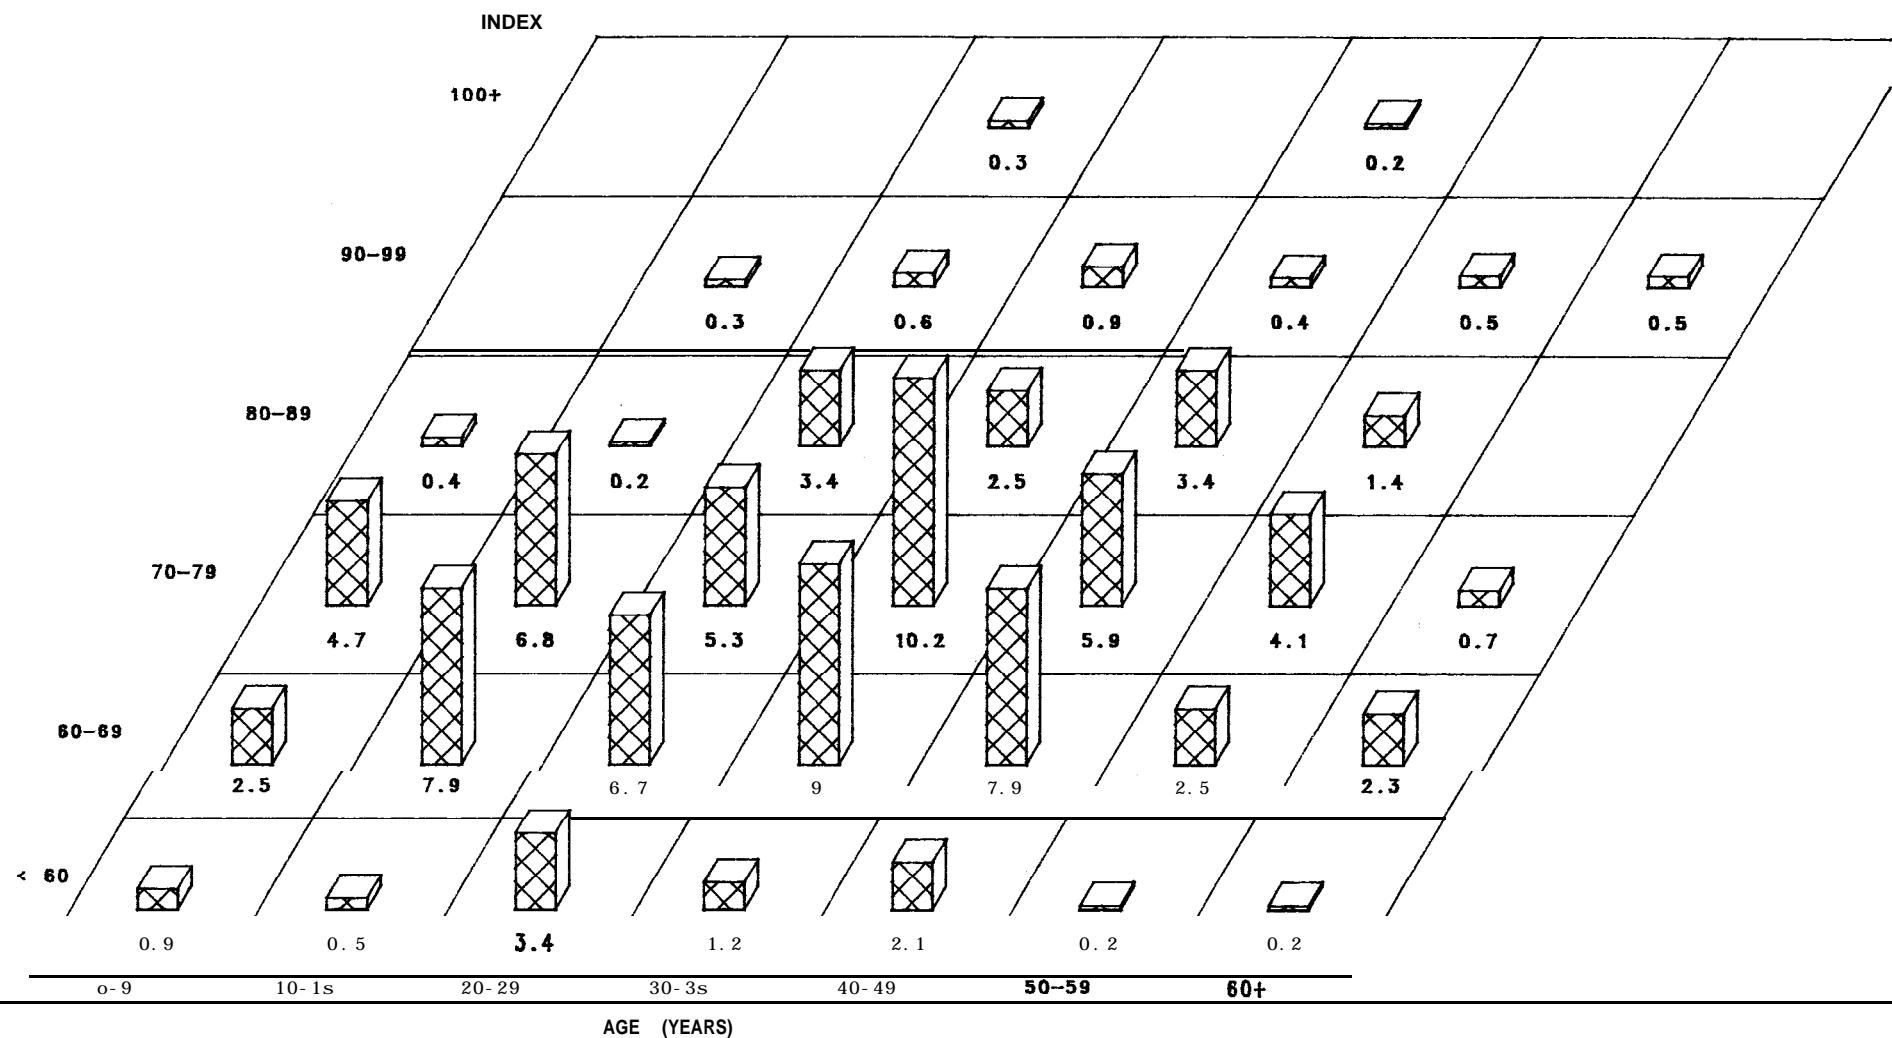

Figure 30A--Percentage distribution of Virginia pine stands in the Piedmont region of the Southeast, by site index and stand age.
(Represents 1,543,863 acres of natural stands, and 27,425 acres of planted stands. Georgia site index data treated as missing values.)

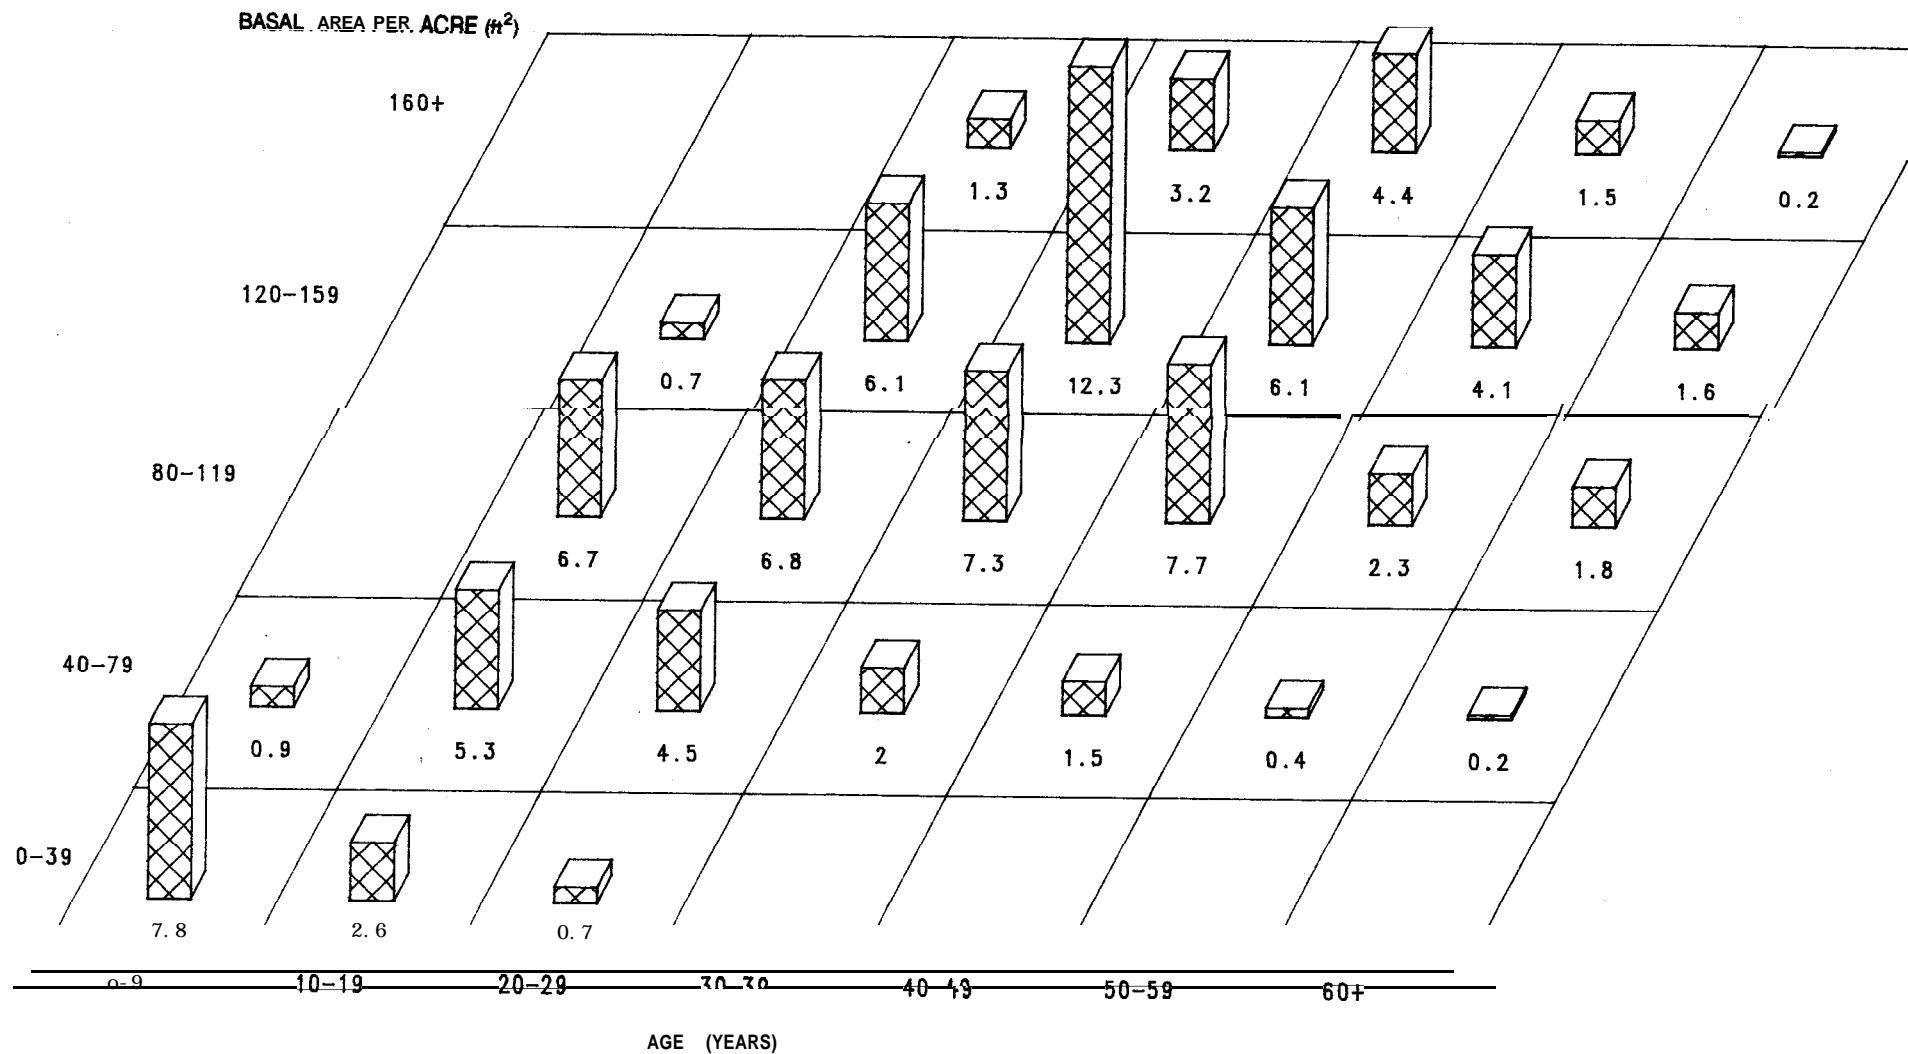

Figure 30B.—Percentage distribution of Virginia pine stands in the Piedmont region of the Southeast by basal area per acre and stand age.
(Represents 1,543,863 acres of natural stands, and 27,425 acres of planted stands.)

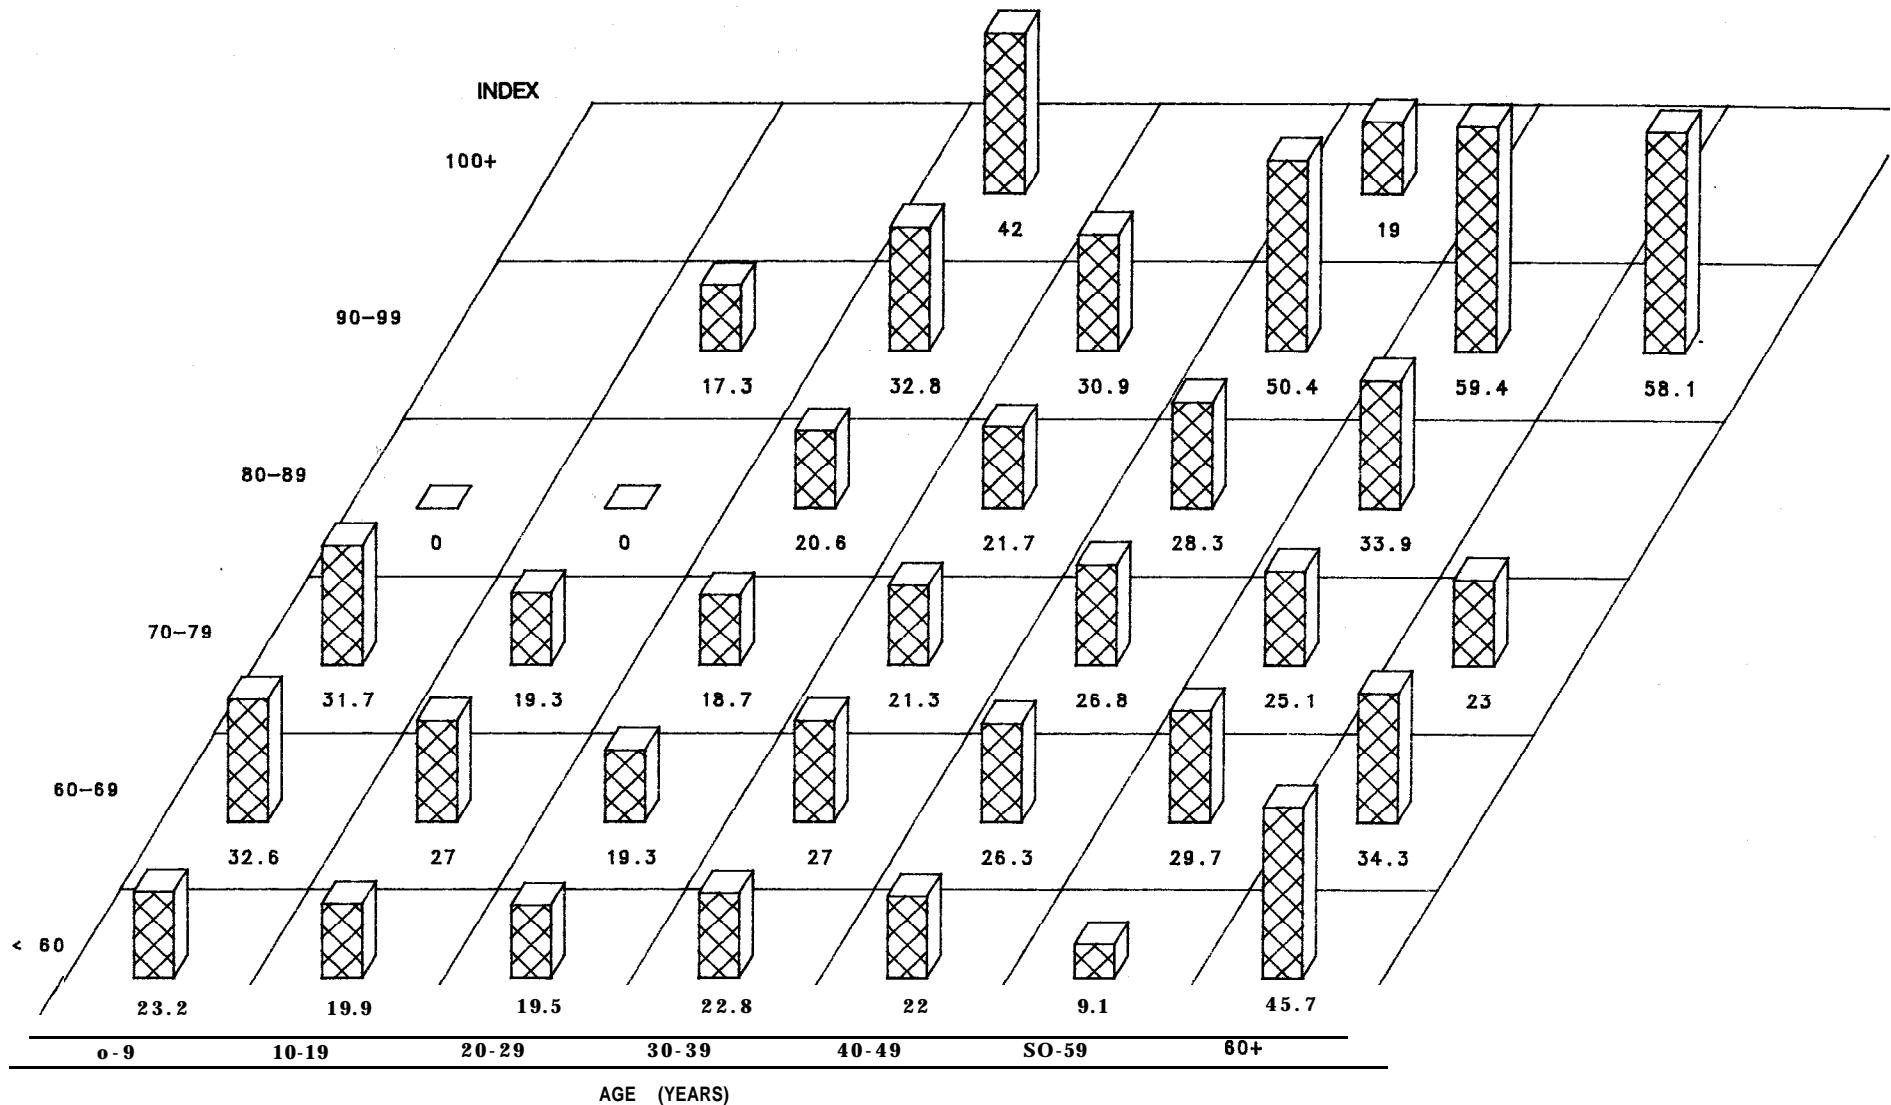

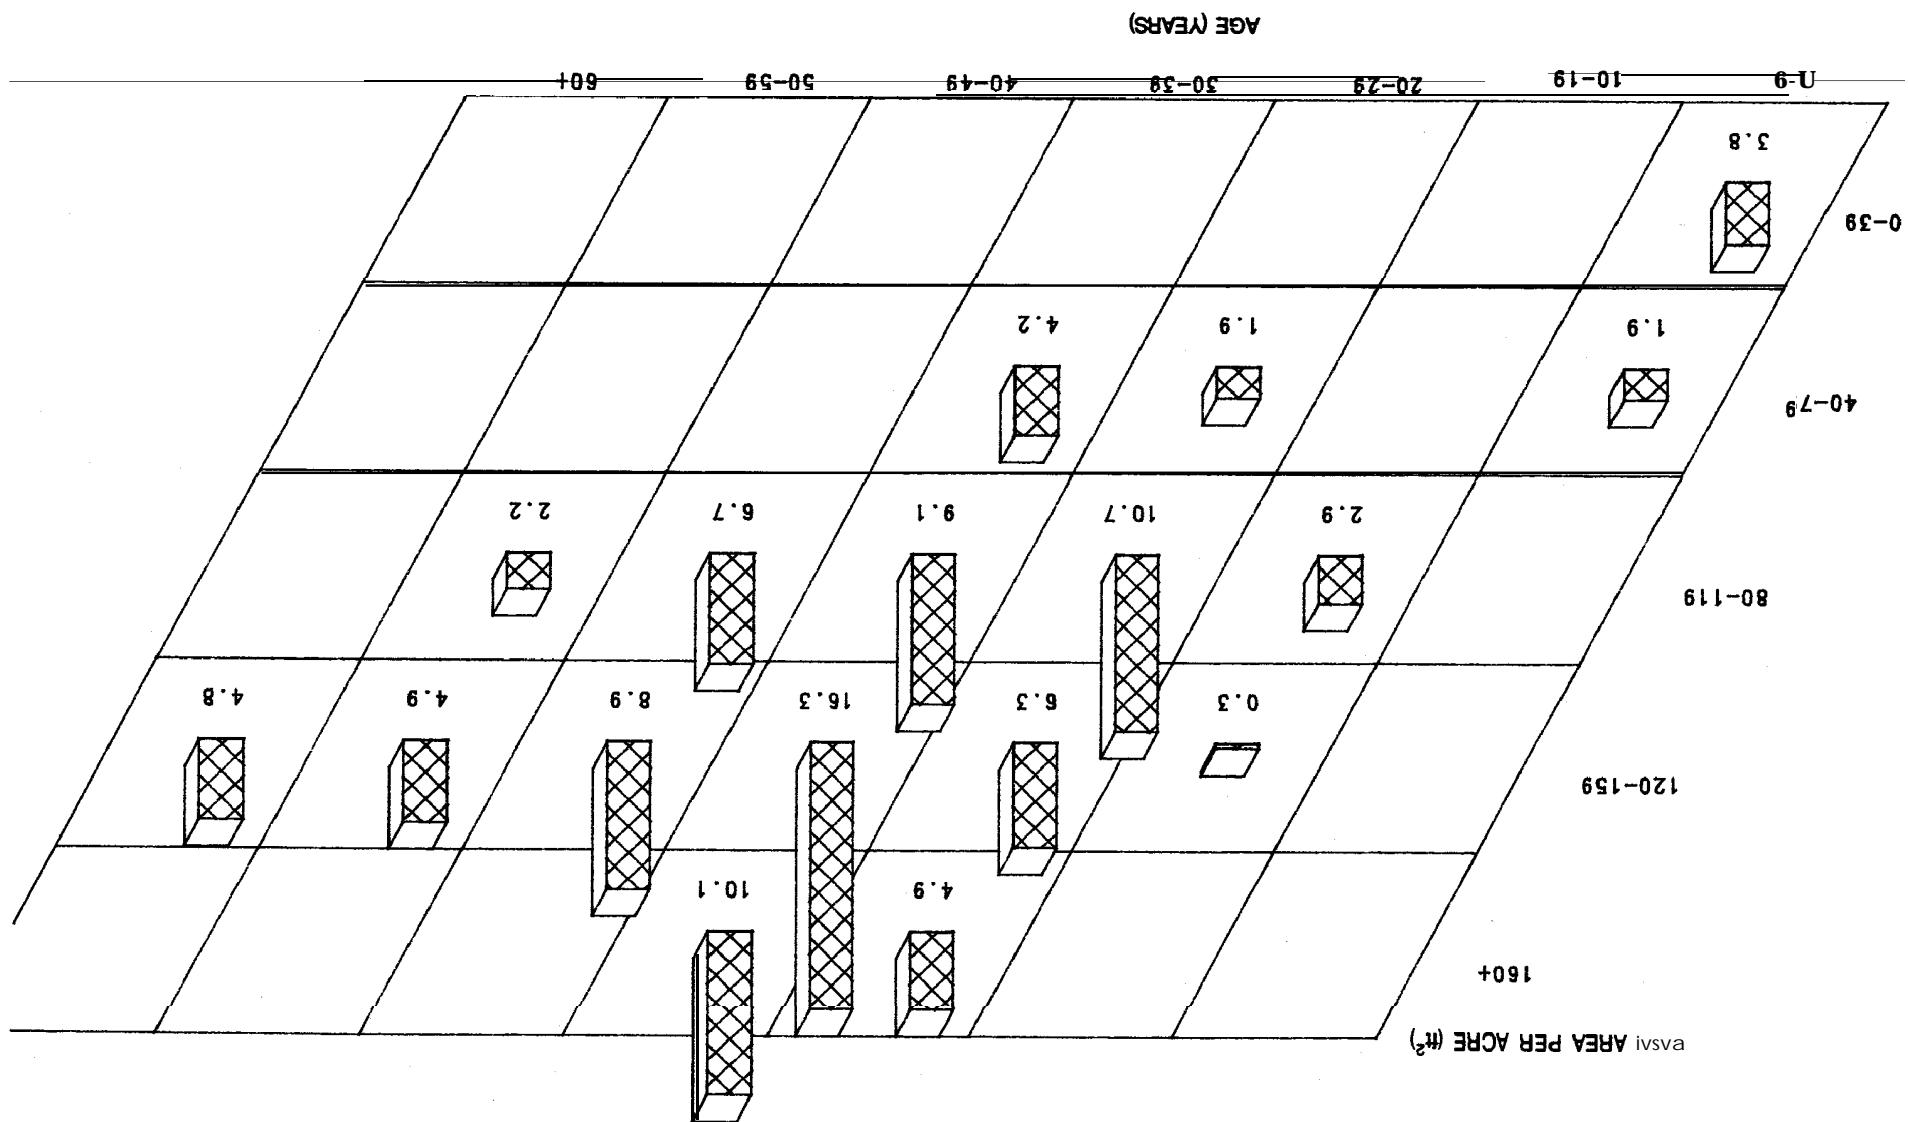

Figure 30C.—Percentage of basal area per acre in **non-yellow-pine** species, by site index and stand age, for Virginia pine stands in the **Piedmont region of the Southeast.** (Represents 1,543,863 acres of natural stands, and 27,425 acres of planted stands. Georgia site index data treated as missing values.)

(Represents 309,929 acres of natural stands, and 3,006 acres of planted stands. Most of sample located in Georgia.)

Figure 32.—Percentage distribution of selected pine stands in the Mountain region of the Southeast, by basal area per acre and stand age.

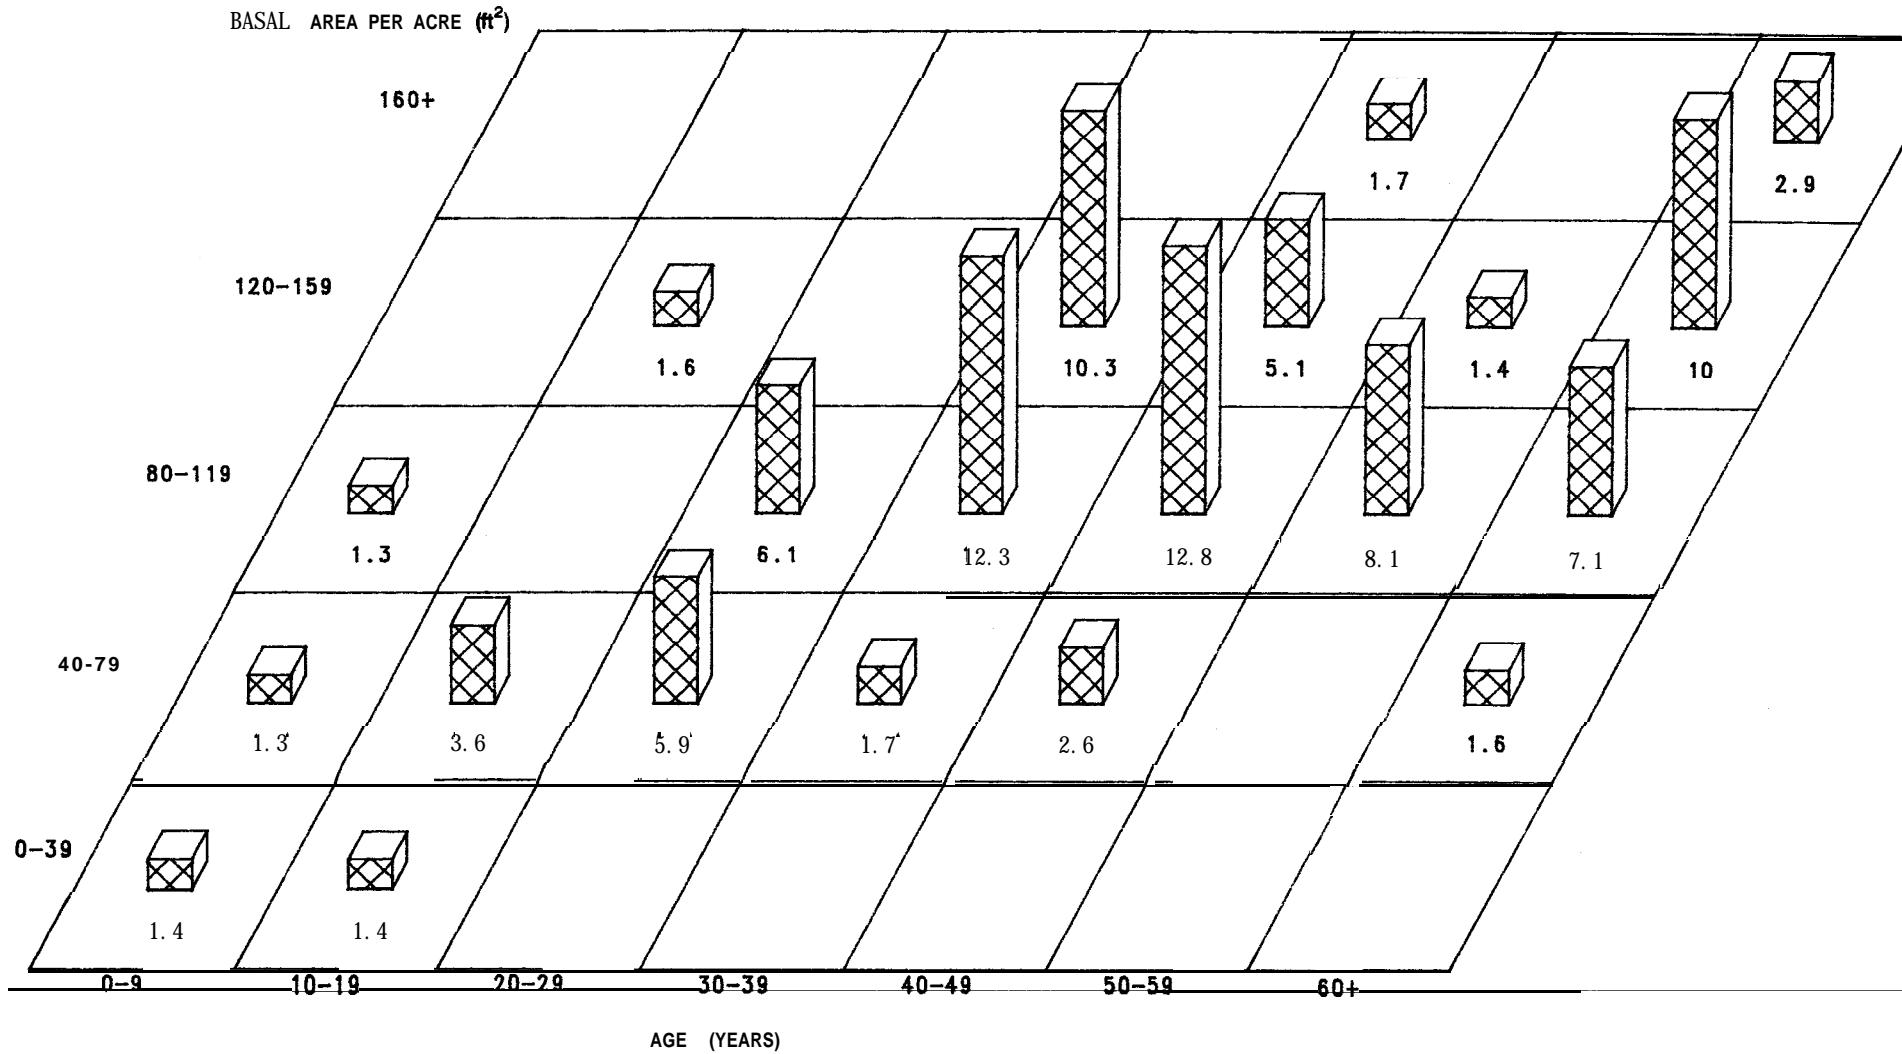

Figure 32.-Percentage distribution of **shortleaf** pine stands in the Mountain region of the Southeast, by basal area per acre and stand age. (Represents 309,929 acres of natural stands, and 3,008 acres of planted stands. Most of sample located in Georgia)

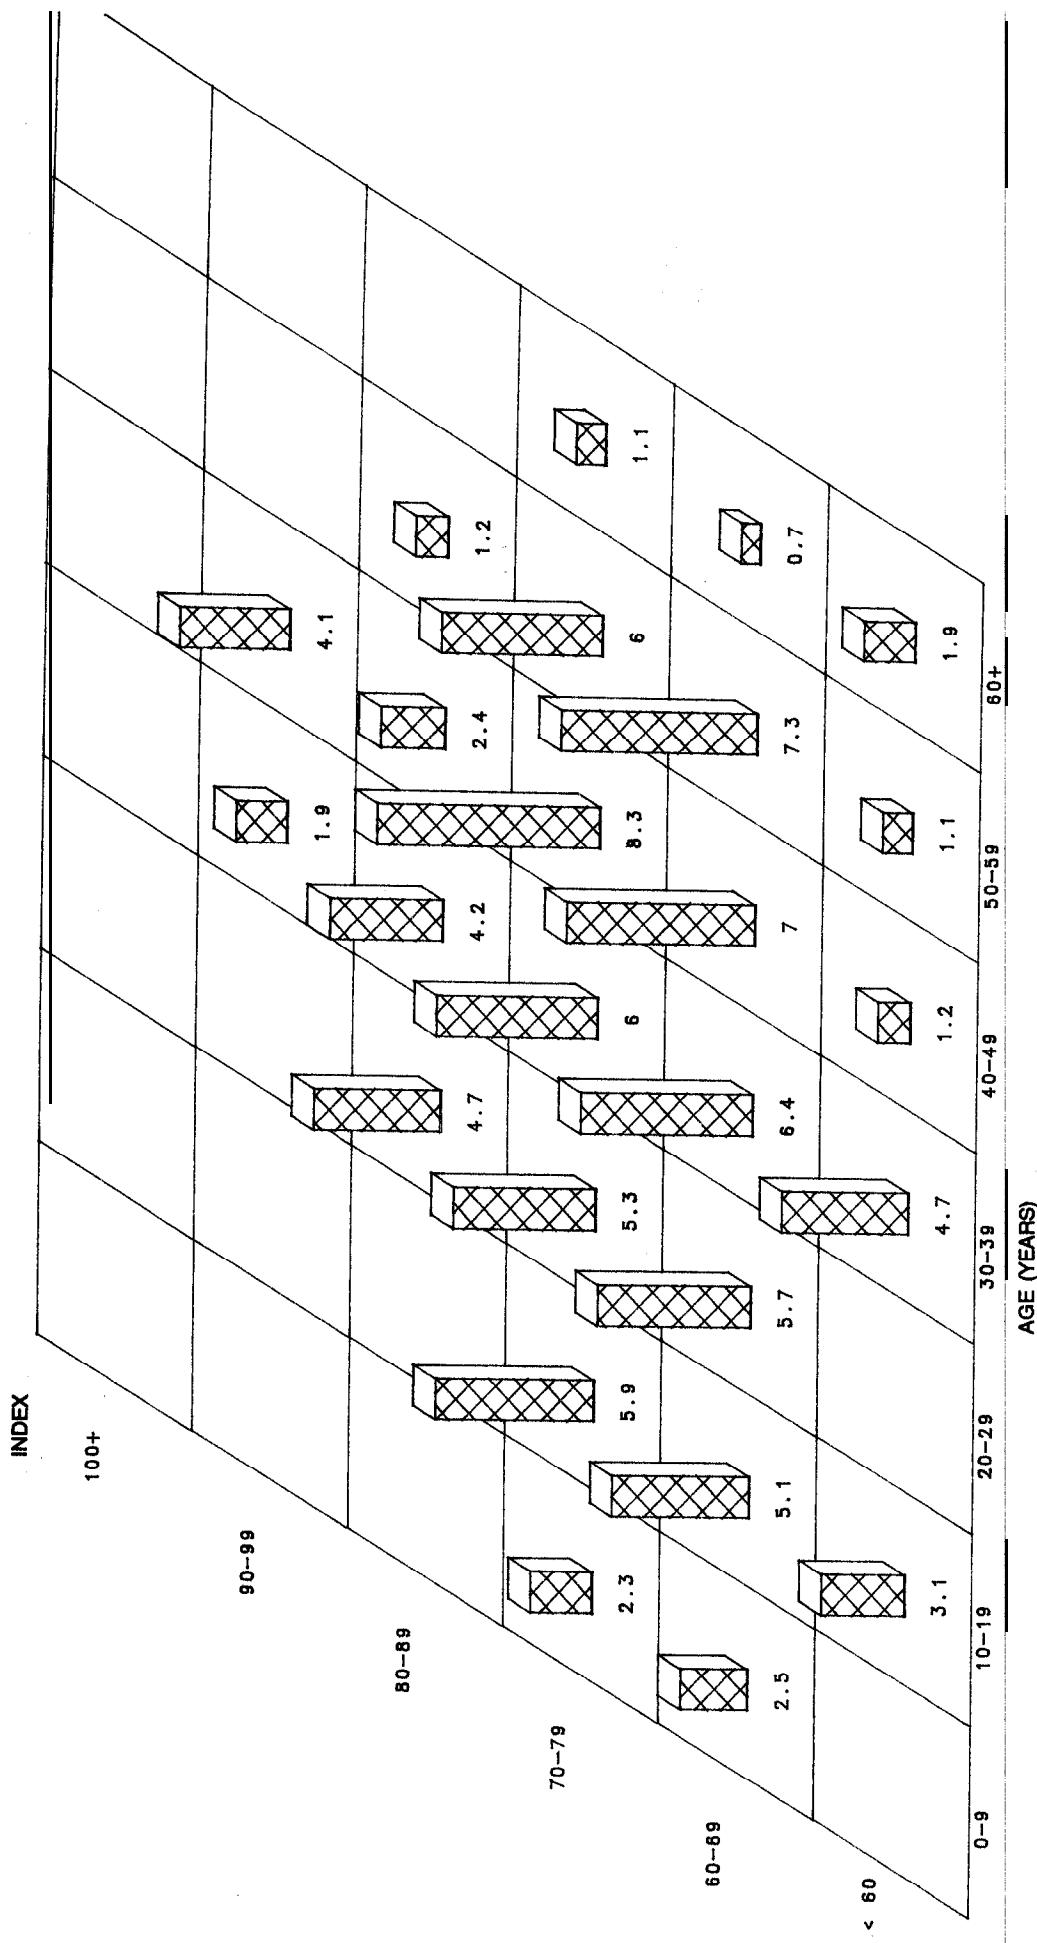

Figure 33A.—Percentage distribution of Virginia pine stands in the Mountain region of the Southeast, by site index and stand age.
(Represents 679,170 acres of natural stands, and 22,589 acres of planted stands. Georgia site index data treated as missing values.)

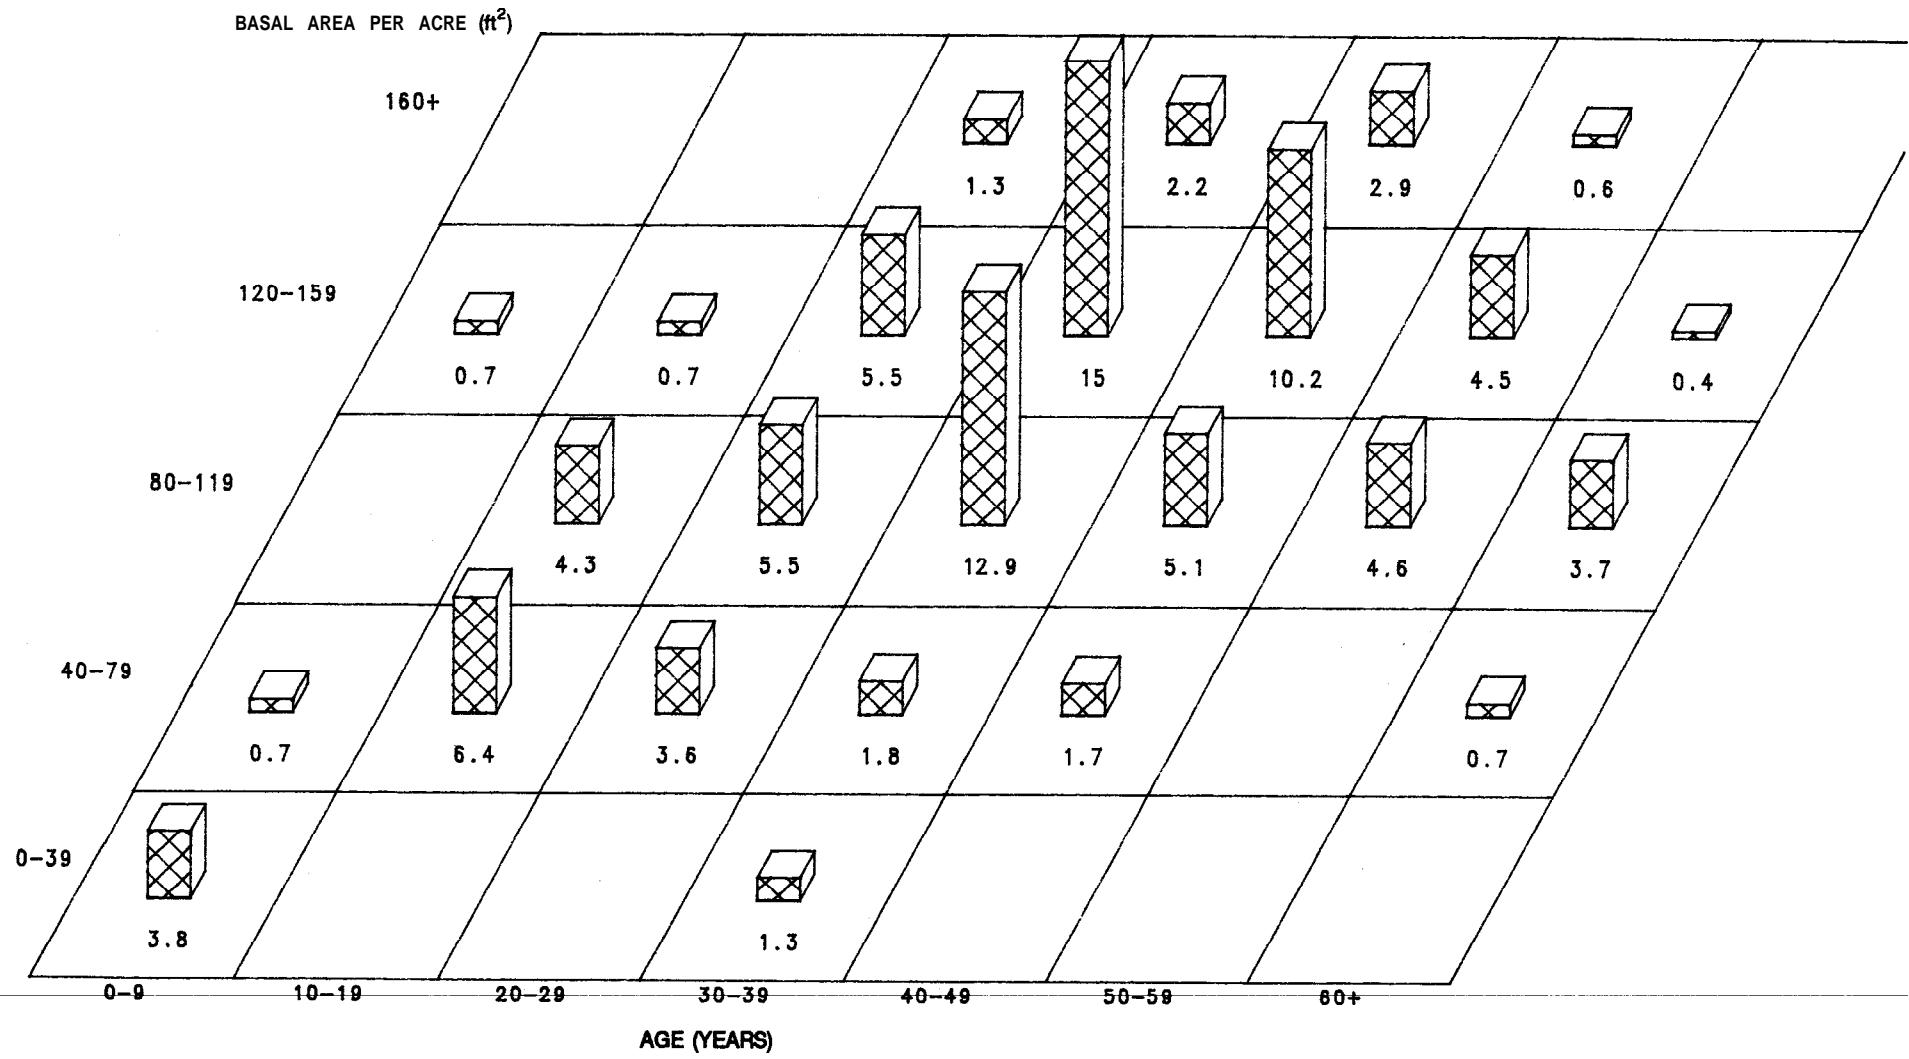

Figure 33B.—Percentage distribution of Virginia pine stands in the Mountain region of the Southeast, by basal area per acre and stand age.
(Represents 679,170 acres of natural stands, and 22,589 acres of planted stands.)

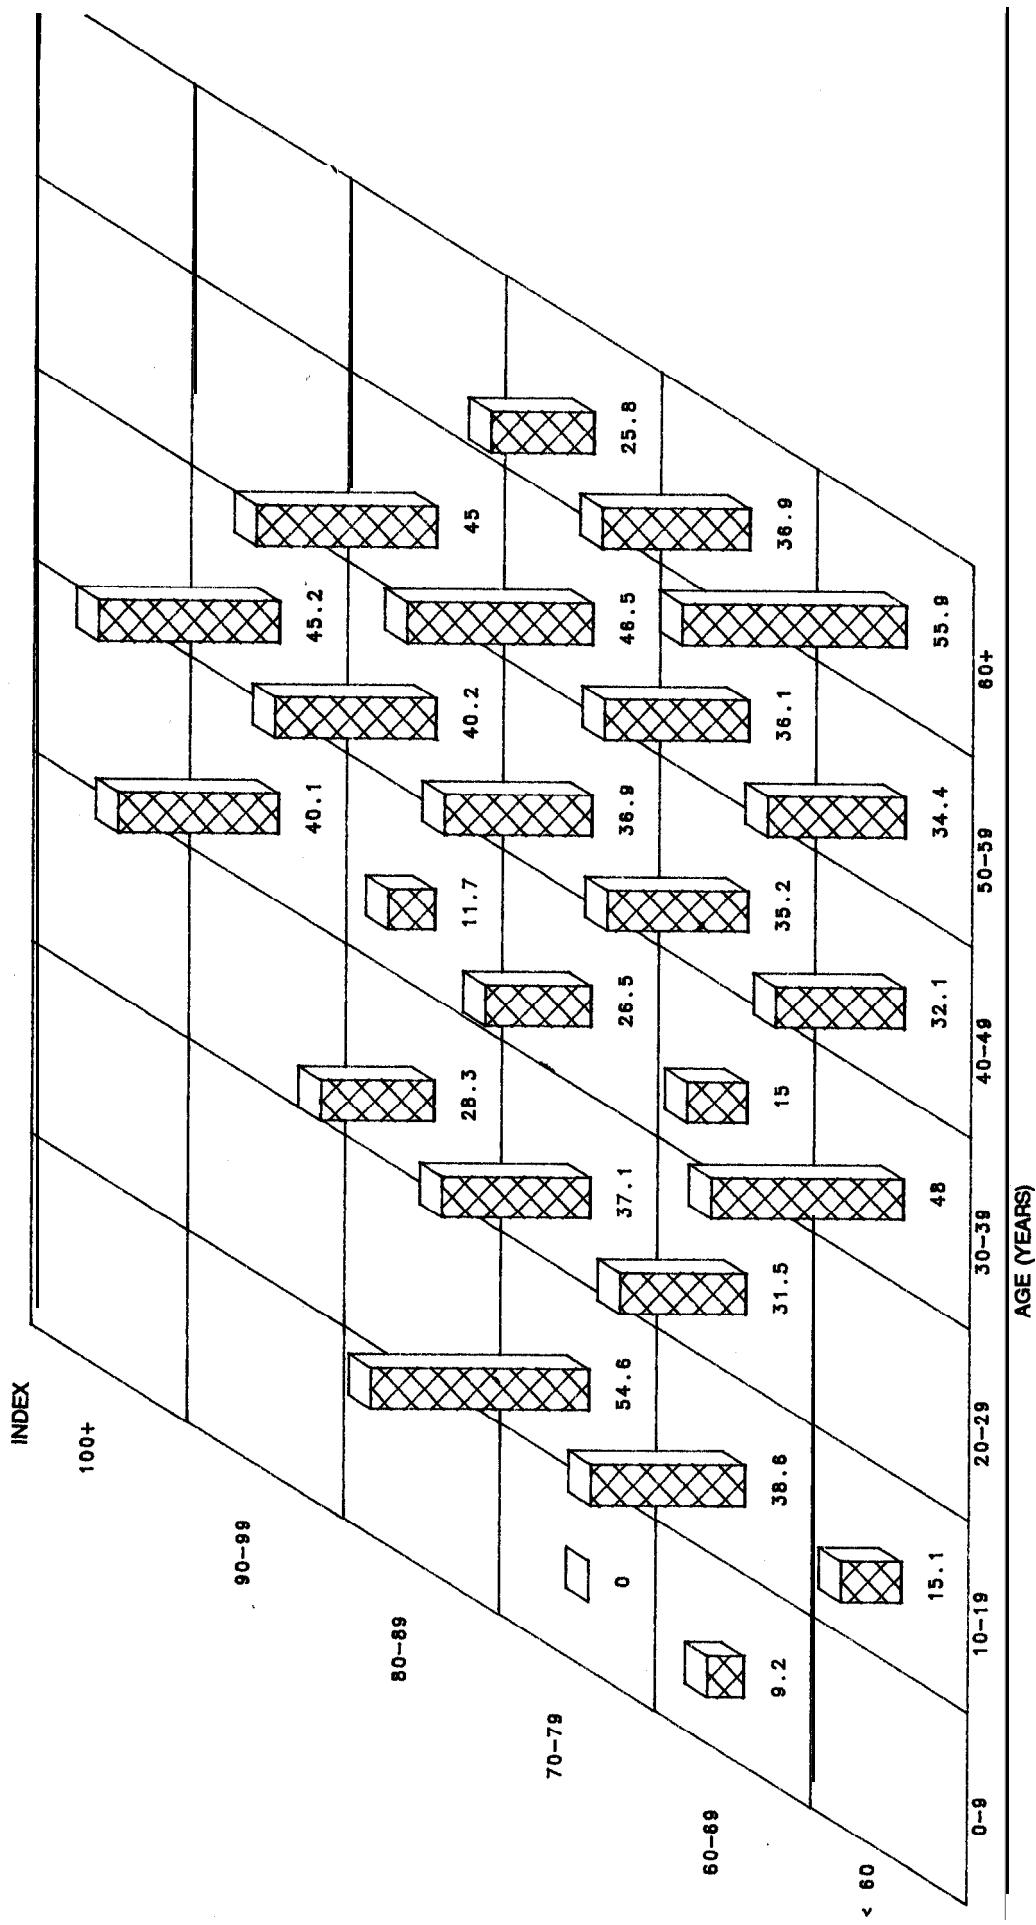

Figure 33C.—Percentage of basal area per acre in nonyellow-species, by site index and stand age, for Virginia pine stands in the Mountain region of the Southeast. (Represents 679,170 acres of natural stands, and 22,589 acres of planted stands. Georgia site index data treated as missing values.)

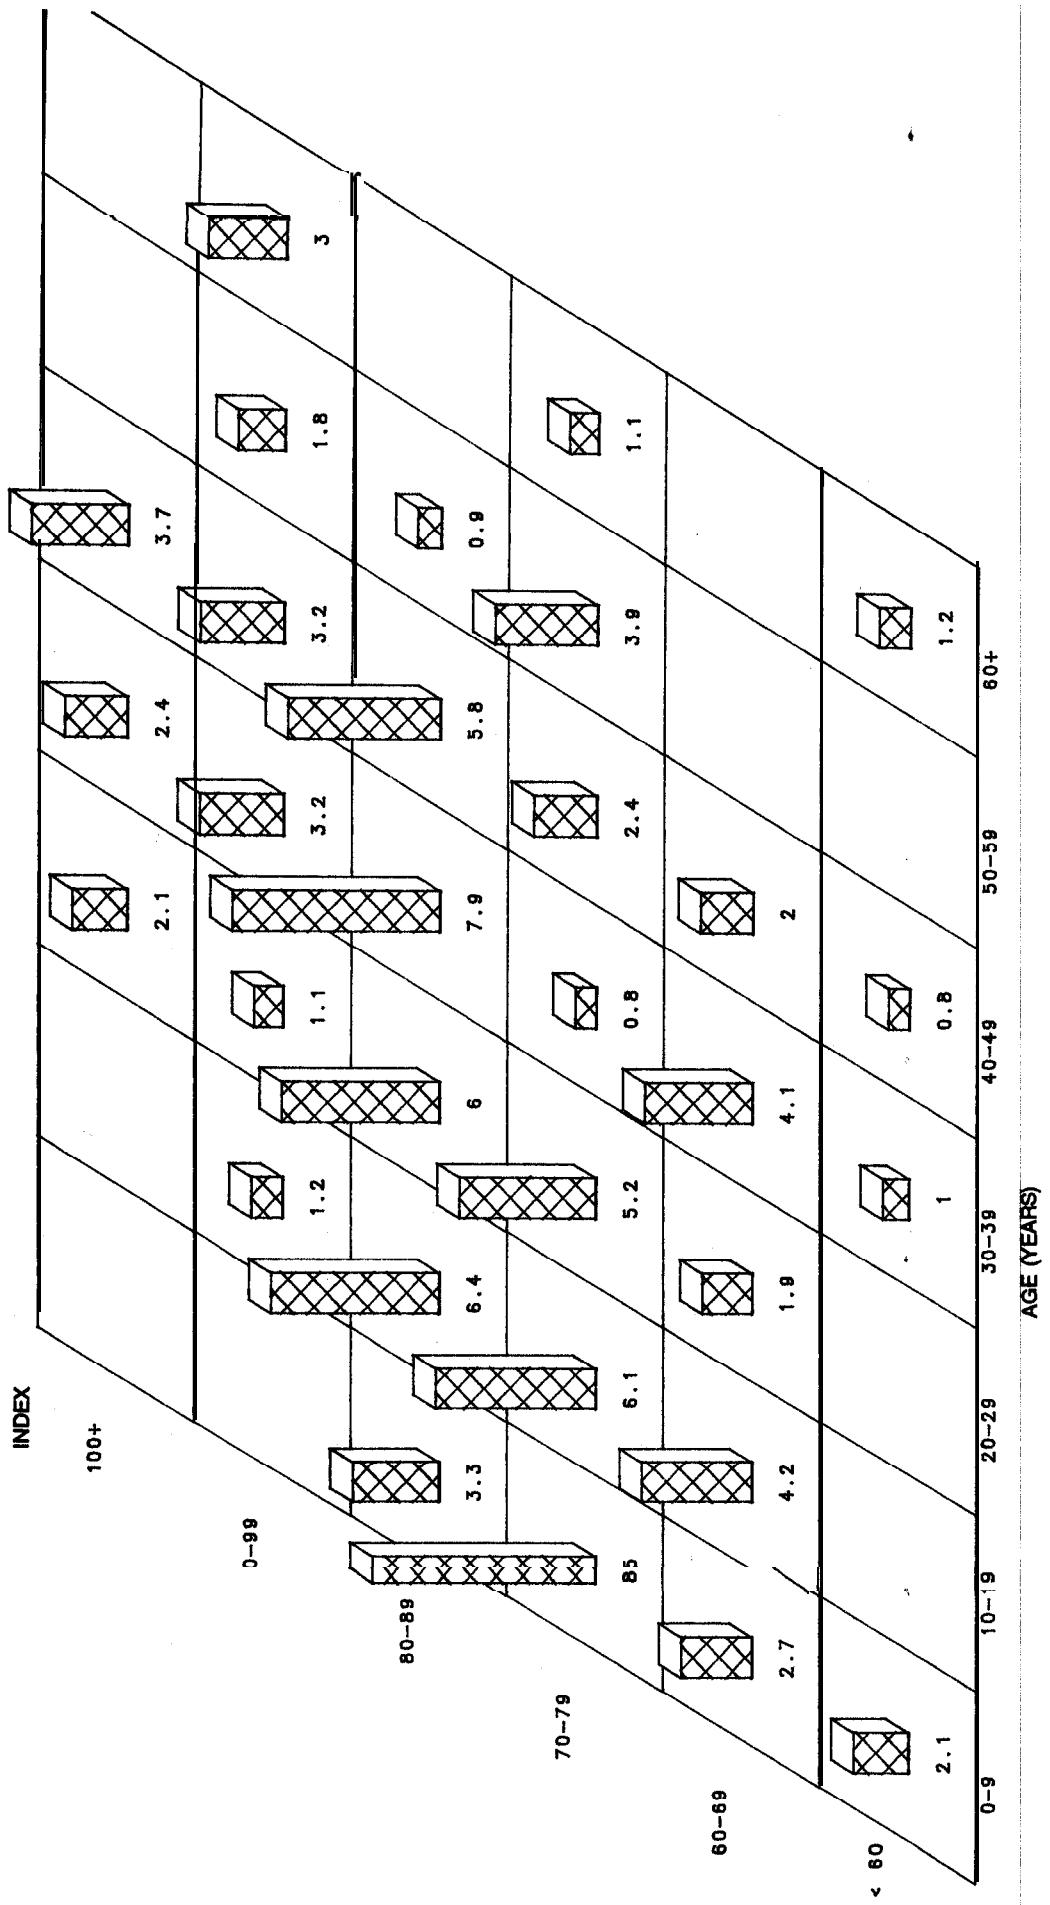

Figure 34A.—Percentage distribution of natural loblolly pine stands in Florida, by site index and stand age. (Represents 261,378 acres.)

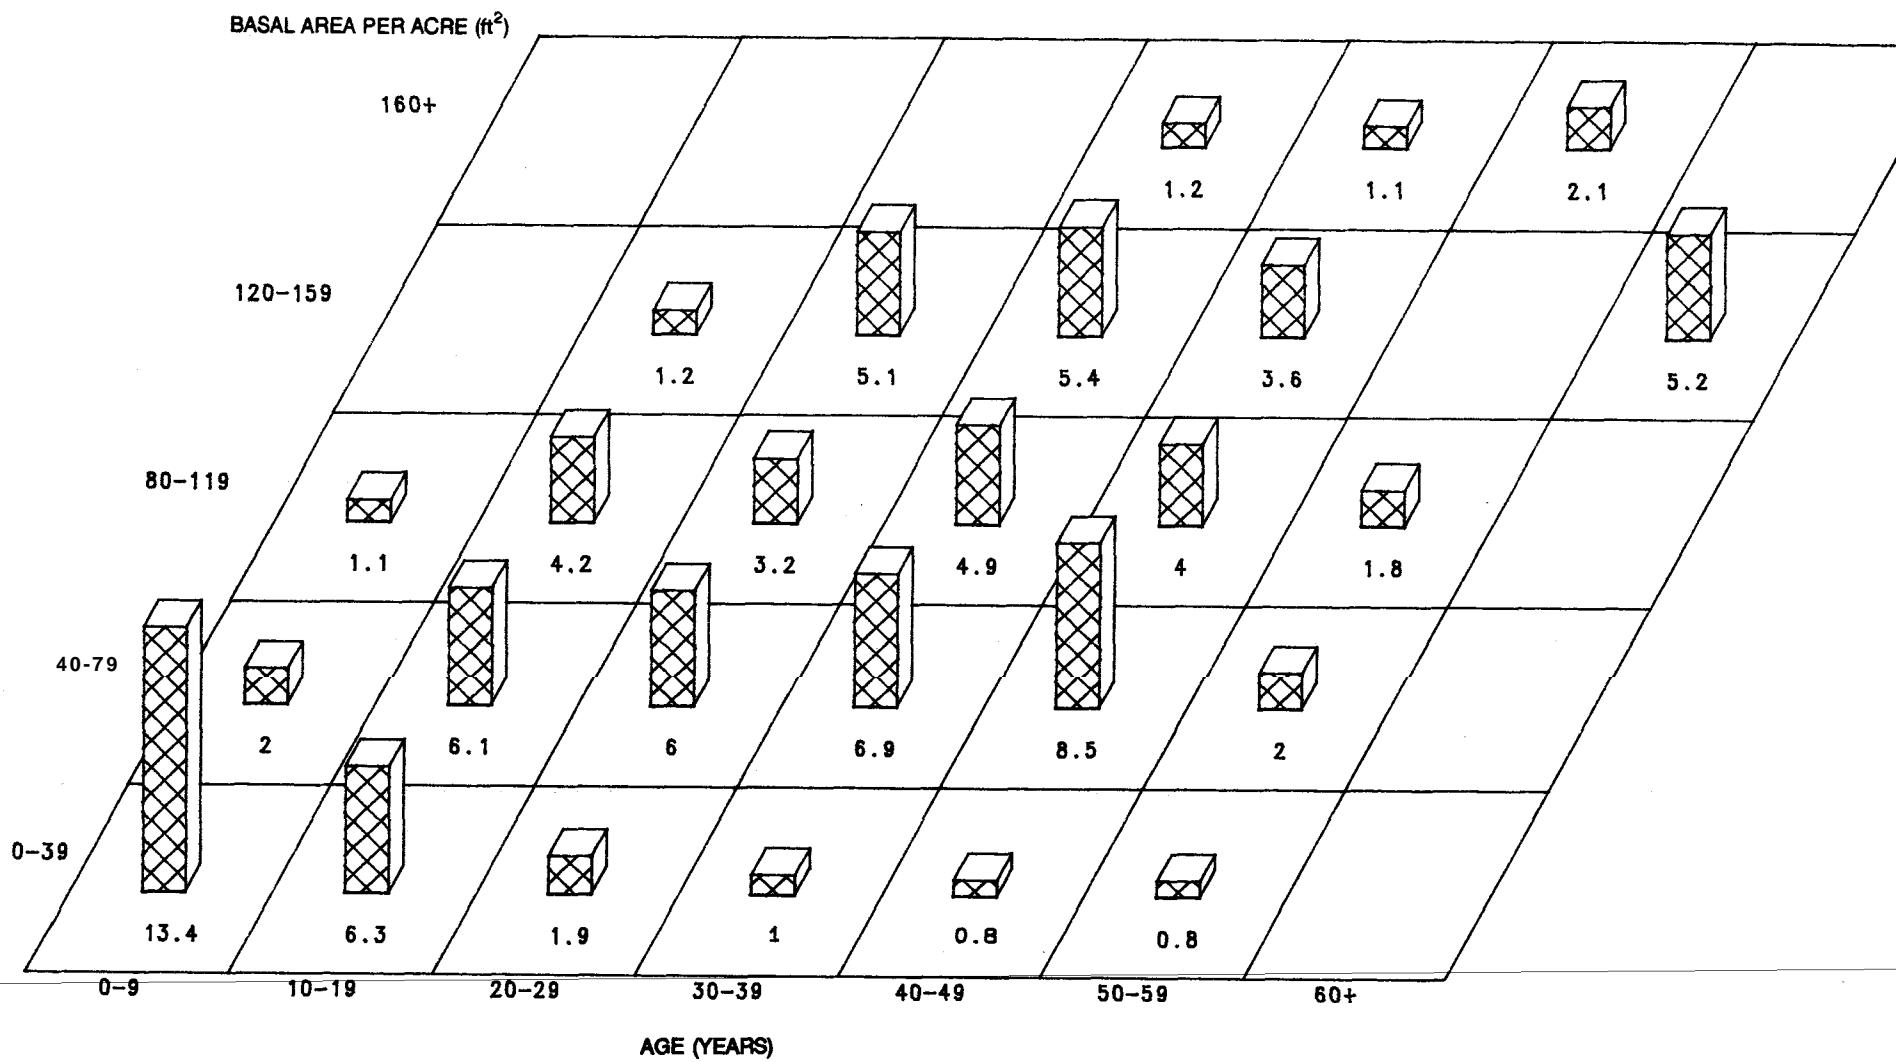

Figure 34B.—Percentage distribution of natural loblolly pine stands in Florida, by basal area per acre and stand age. (Represents 261,378 acres.)

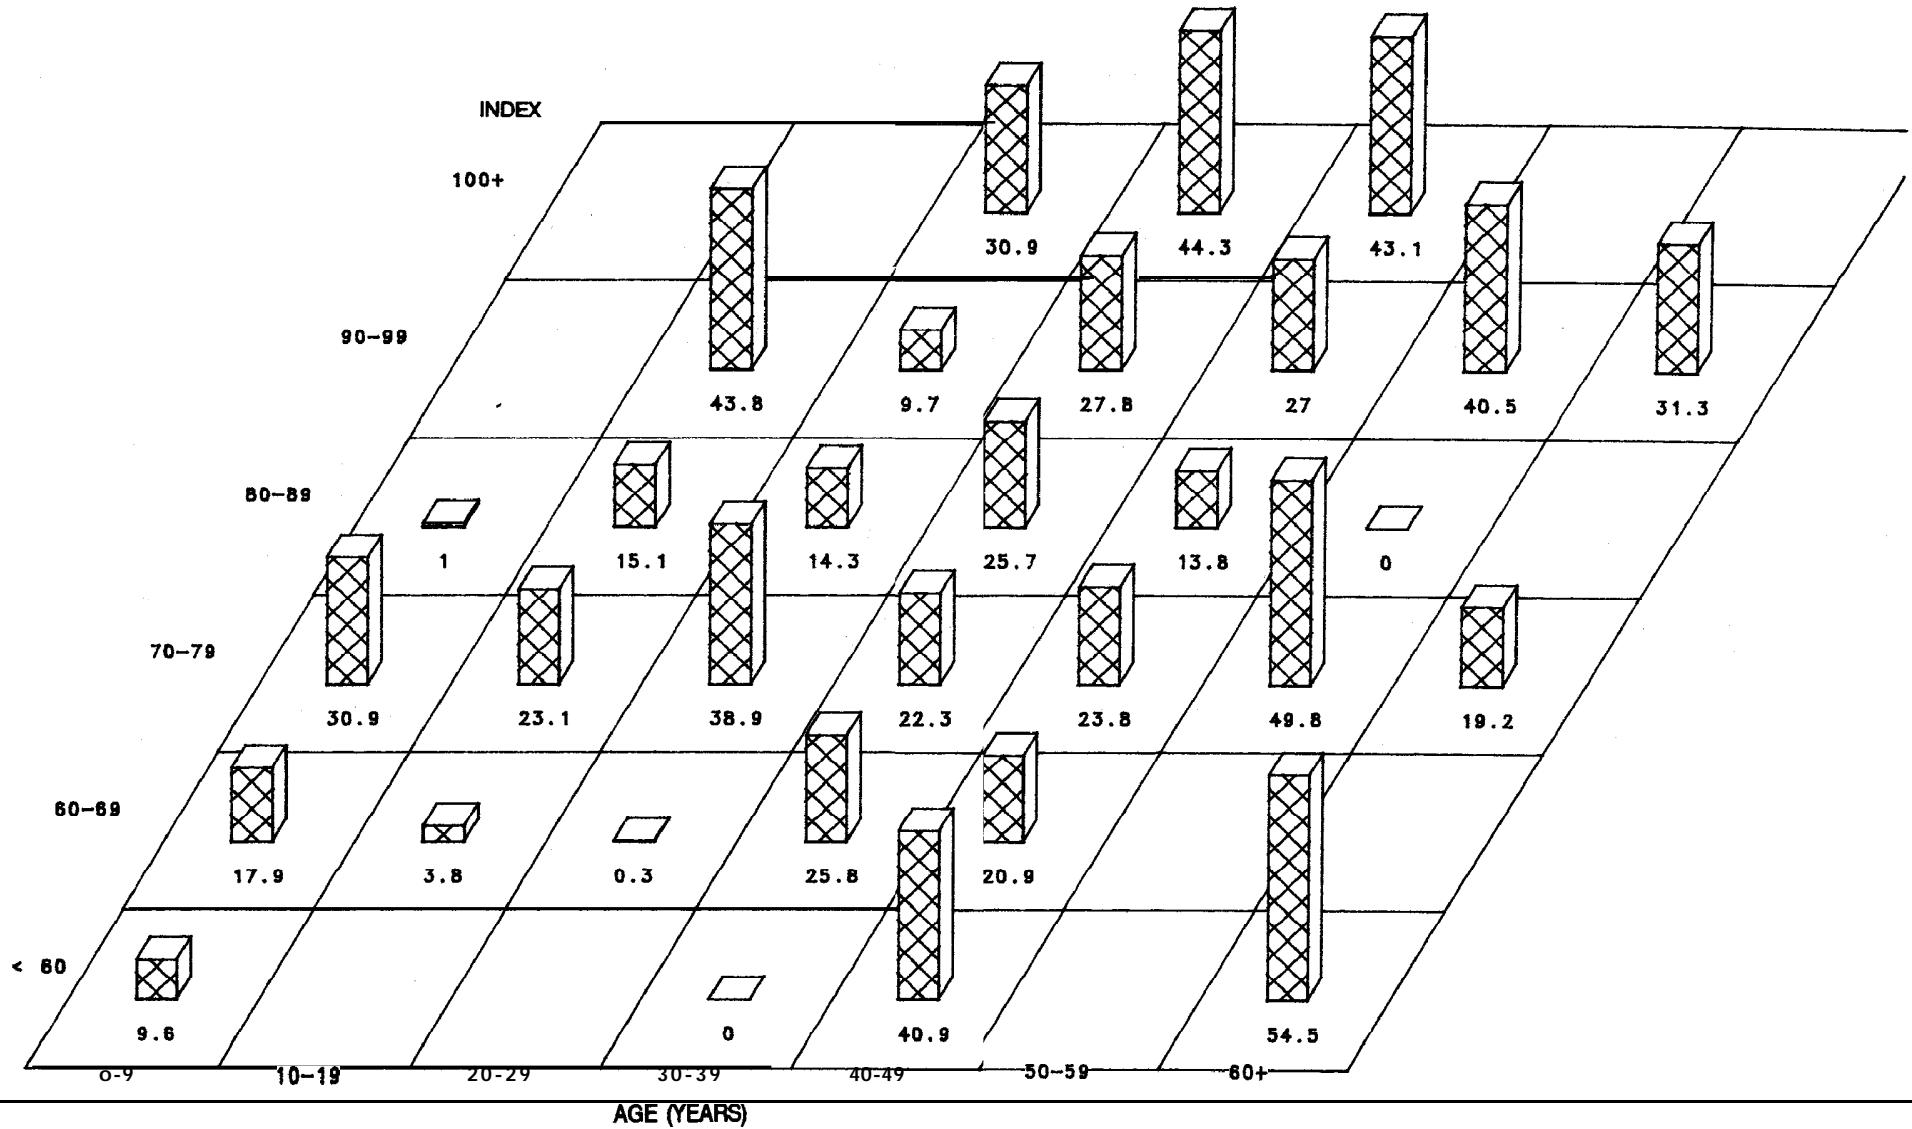

Figure 34C.—Percentage of basal area per acre in non-yellowpine species, by site index and stand age, for natural **loblolly** pine stands in Florida (Represents 261,378 acres.)

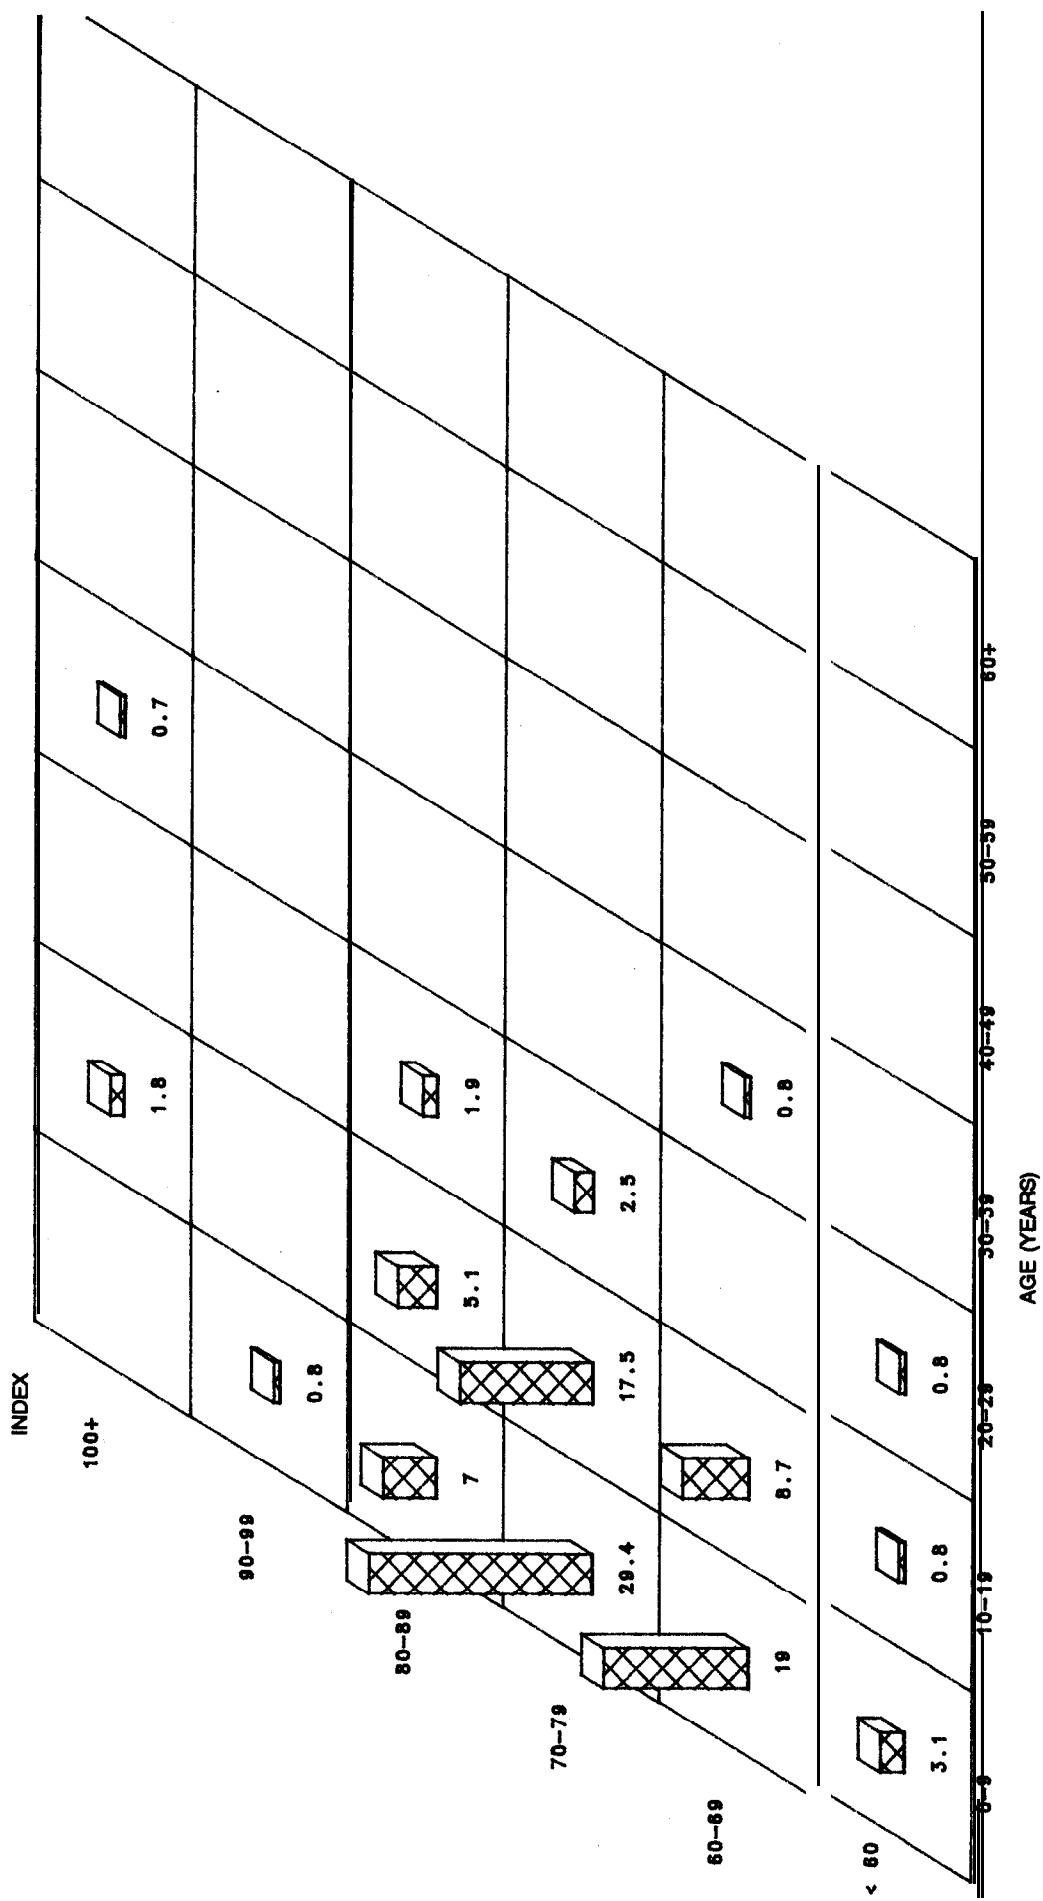

Figure 35A.—Percentage distribution of planted loblolly pine stands in Florida, by site index and stand age. (Represents 317,094 acres.)

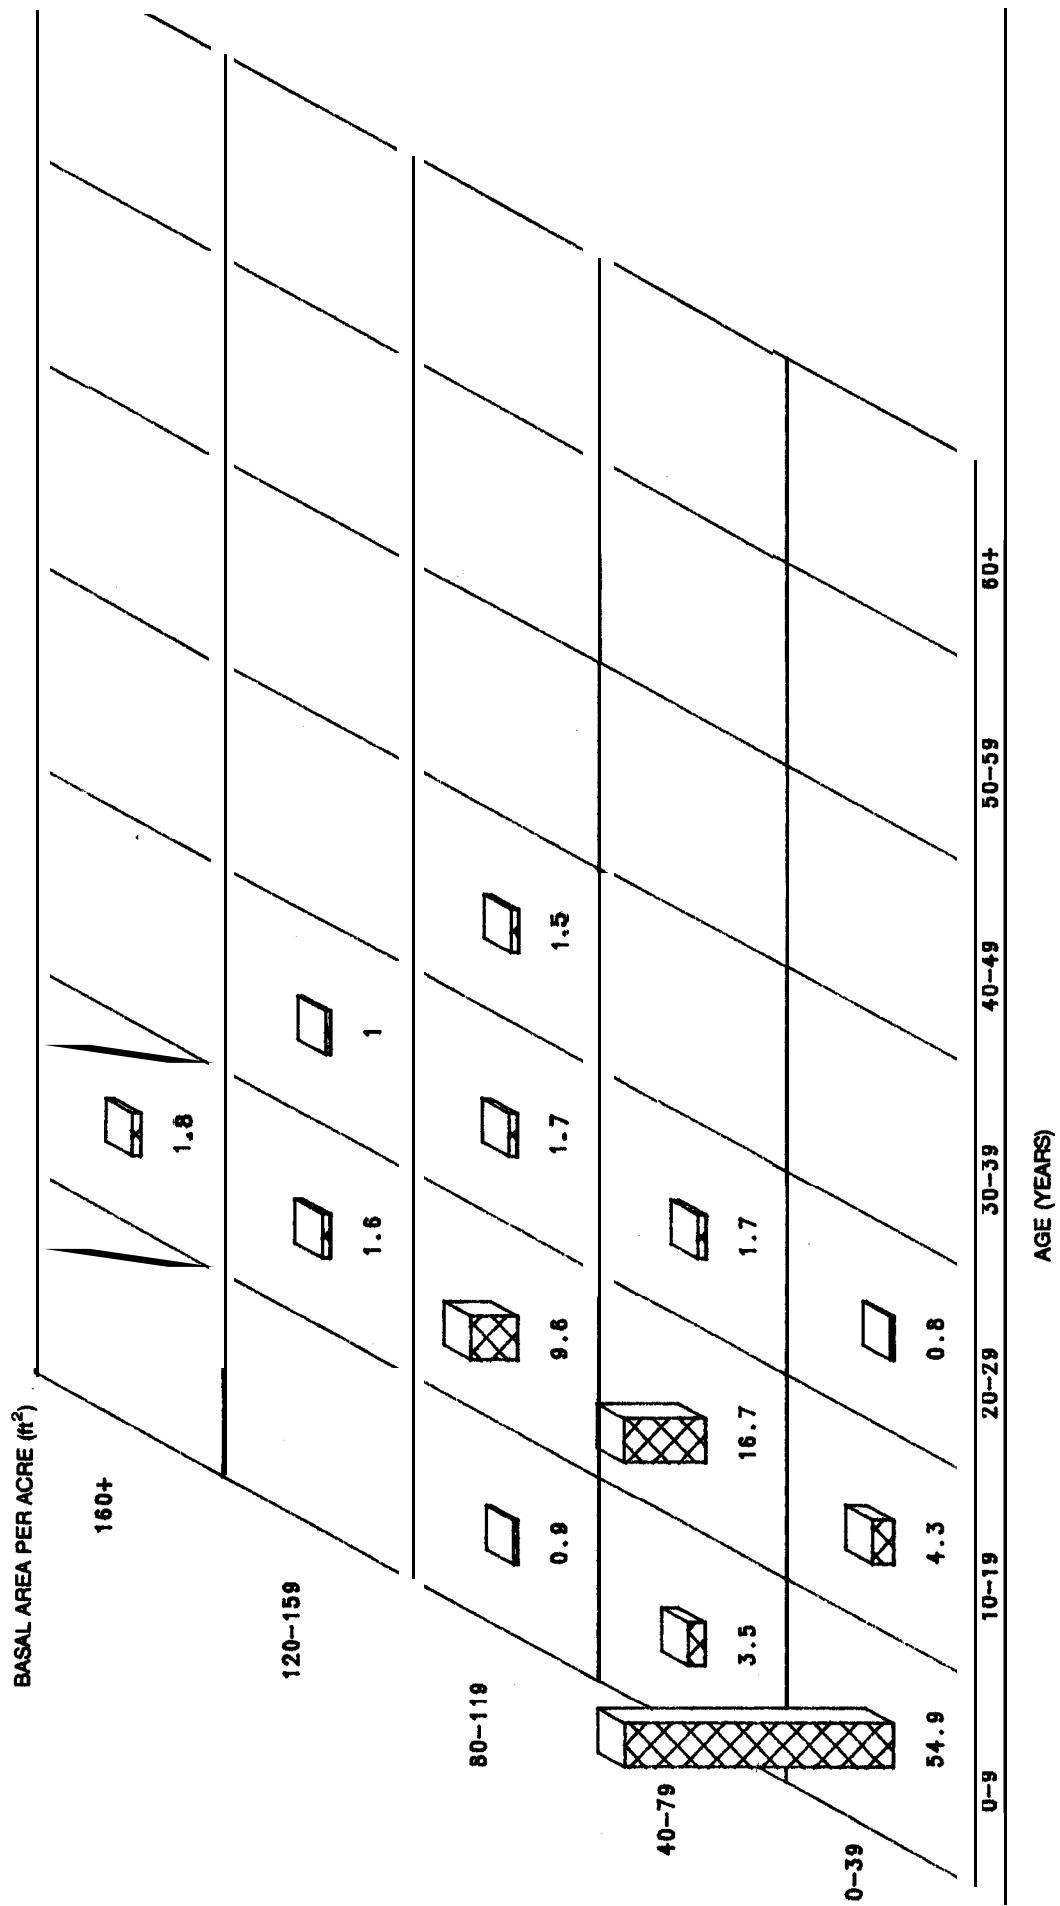

Fig. 35B percentage distribution of planted loblolly pine stands in Florida, by basal area per acre and stand age. (Represents 317,094 acres.)

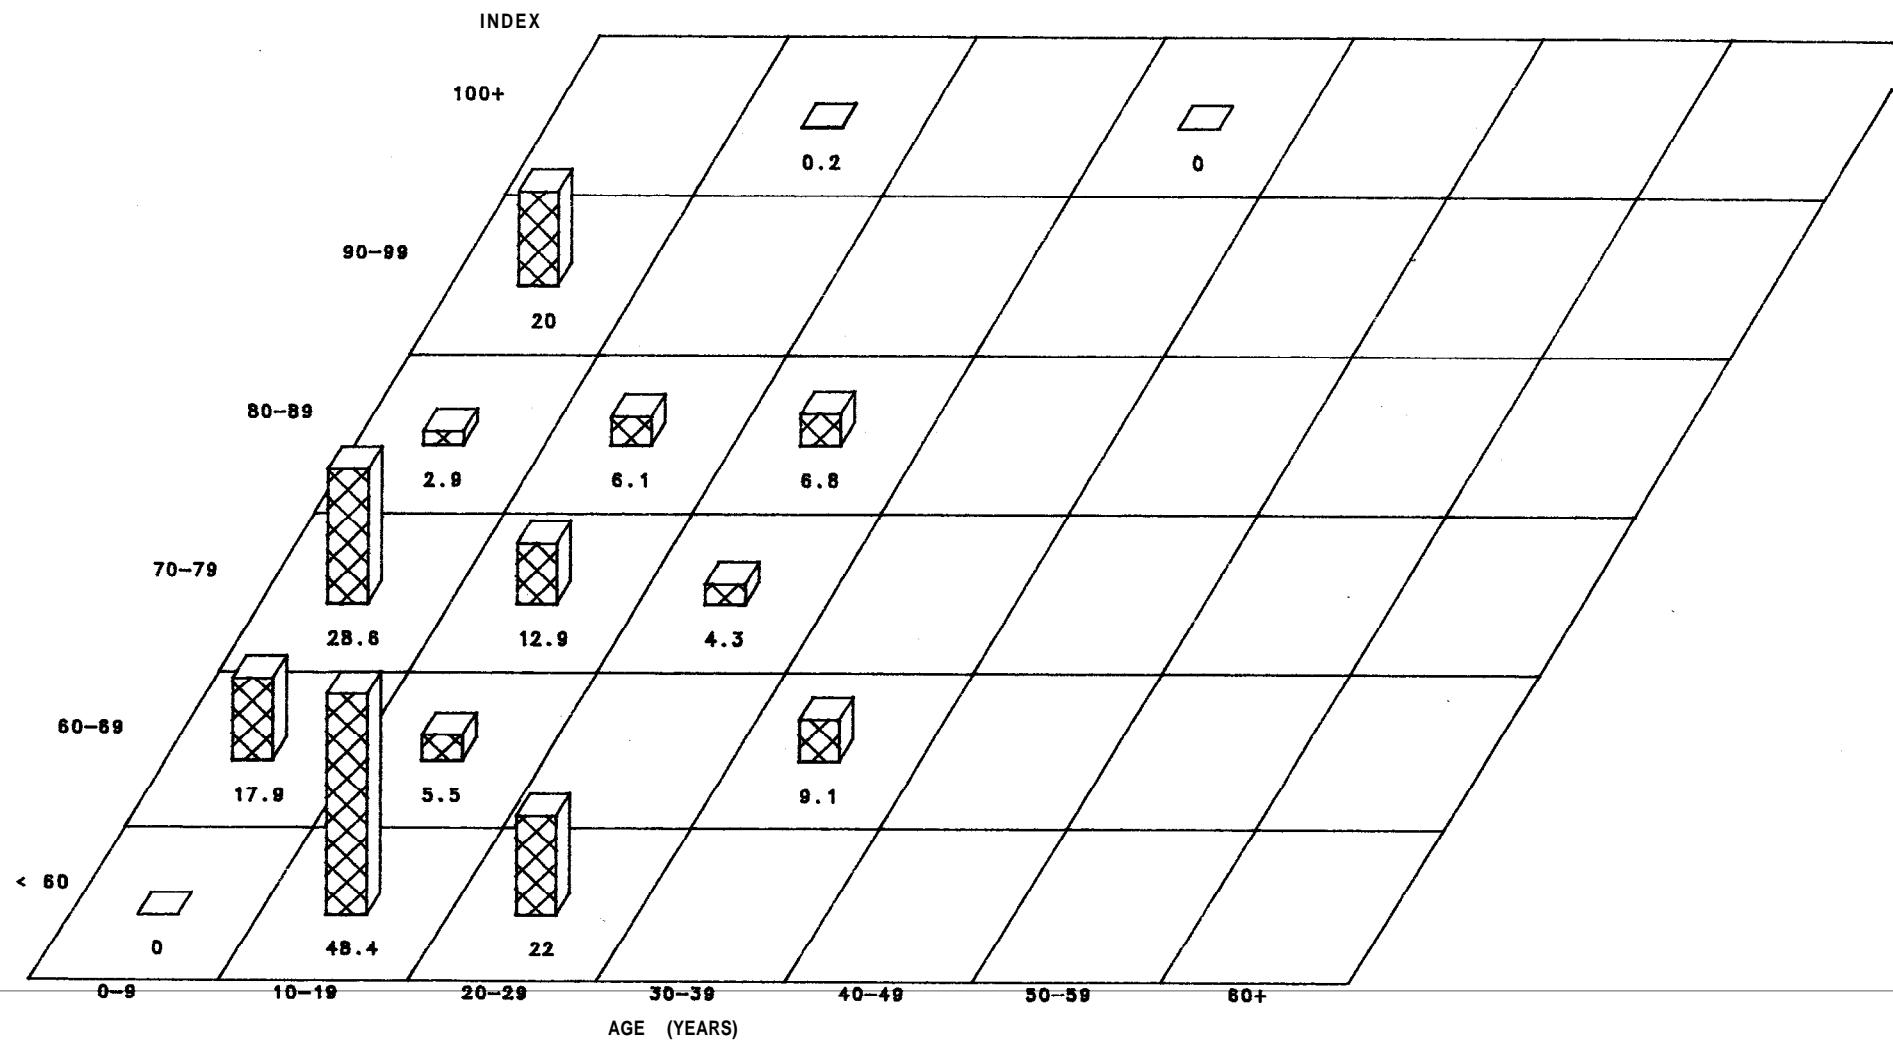

Figure 35C.—Percentage of basal area per acre in non-yellowpine species, by site index and stand age, for planted loblolly pine stands in Florida. (Represents 317,094 acres.)

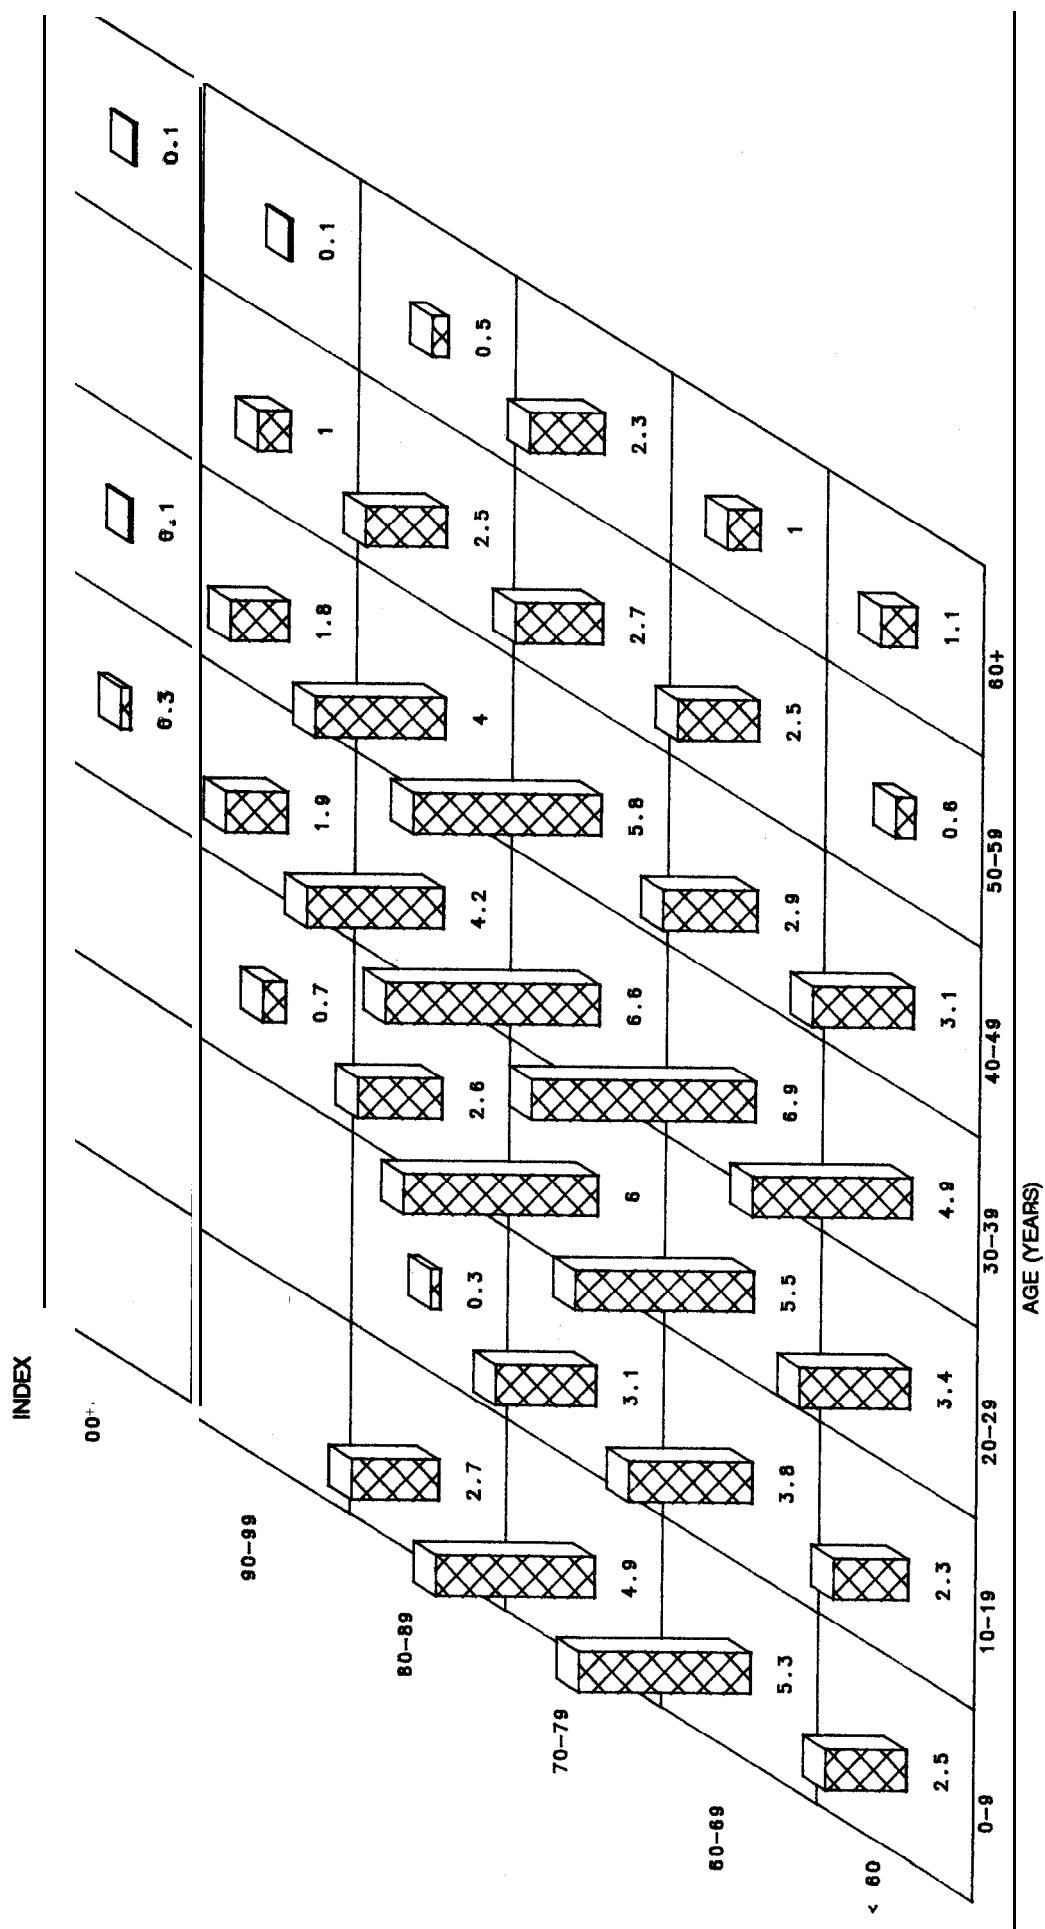

Figure 36A.—Percentage distribution of natural slash pine stands in Florida, by site index and stand age. (Represents 1,903,105 acres.)

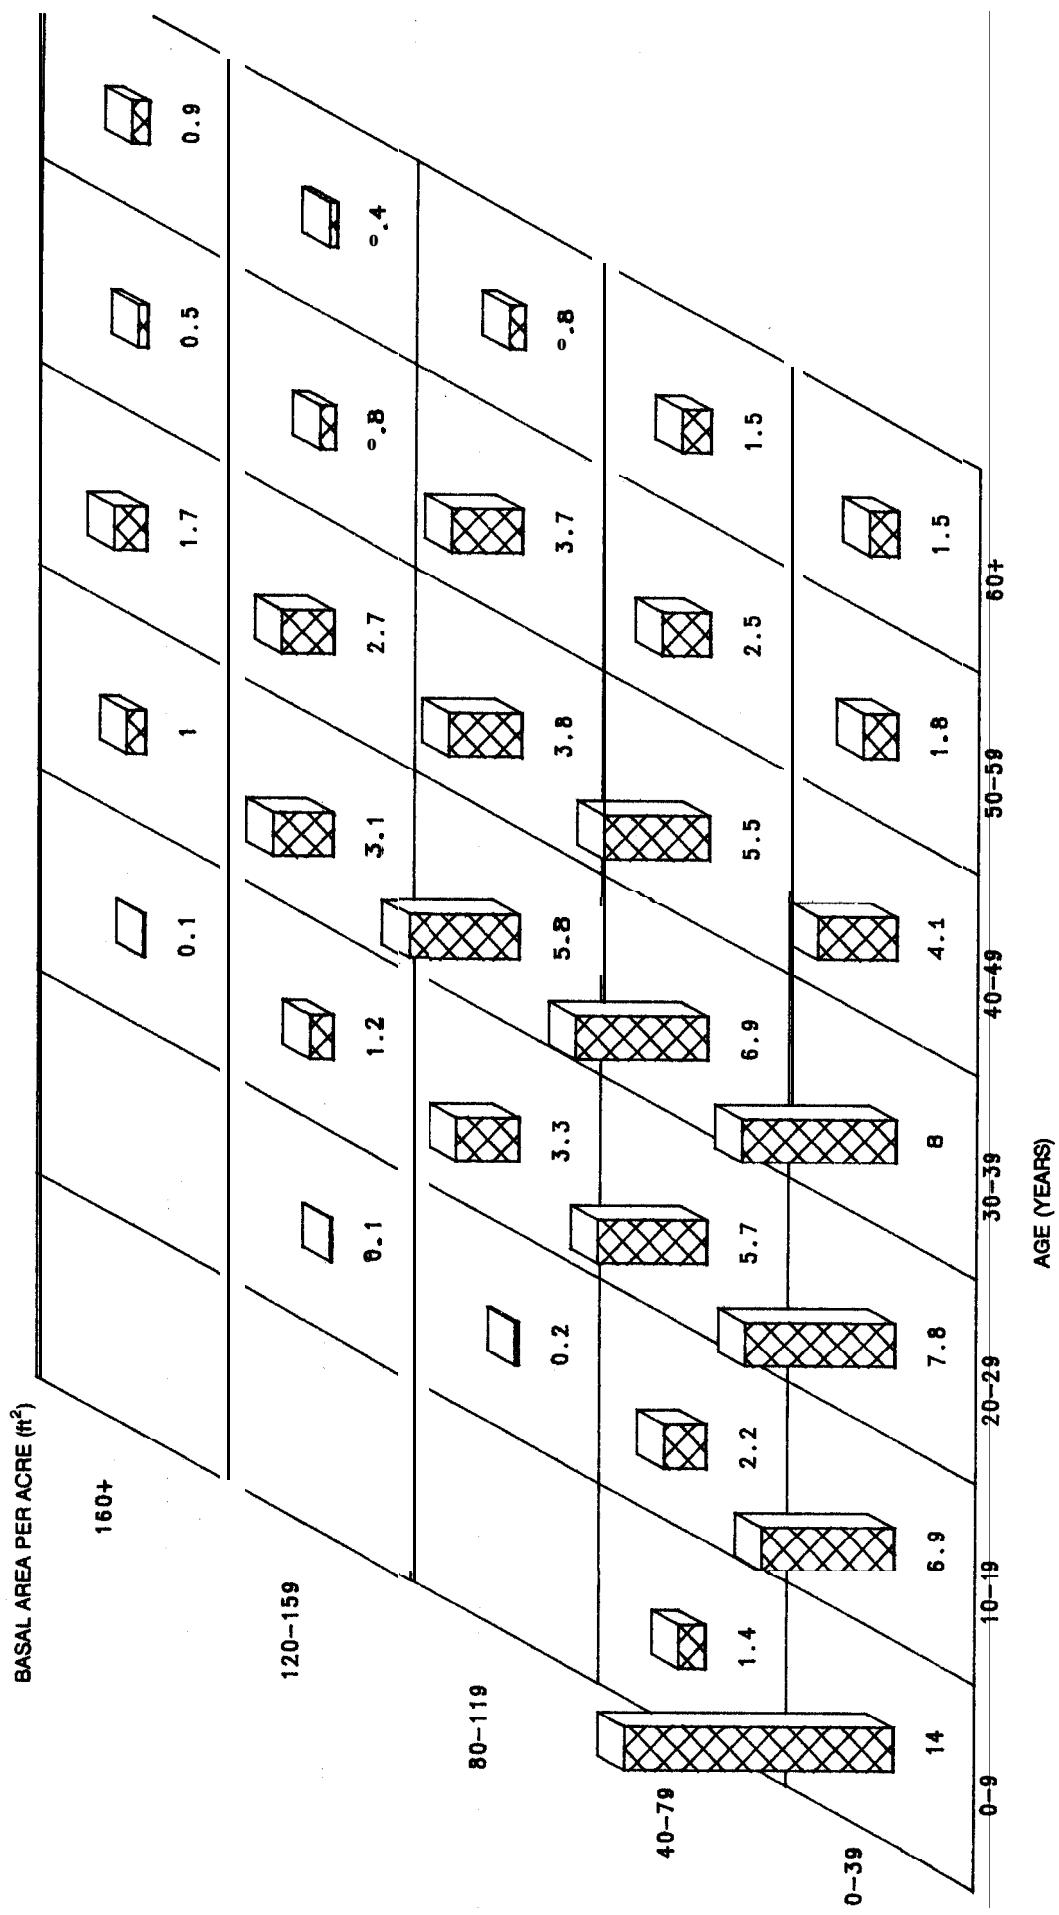

Figure 36B.—Percentage distribution of natural slash pine stands in Florida, by basal area per acre and stand age. (Represents 1,903,105 acres.)

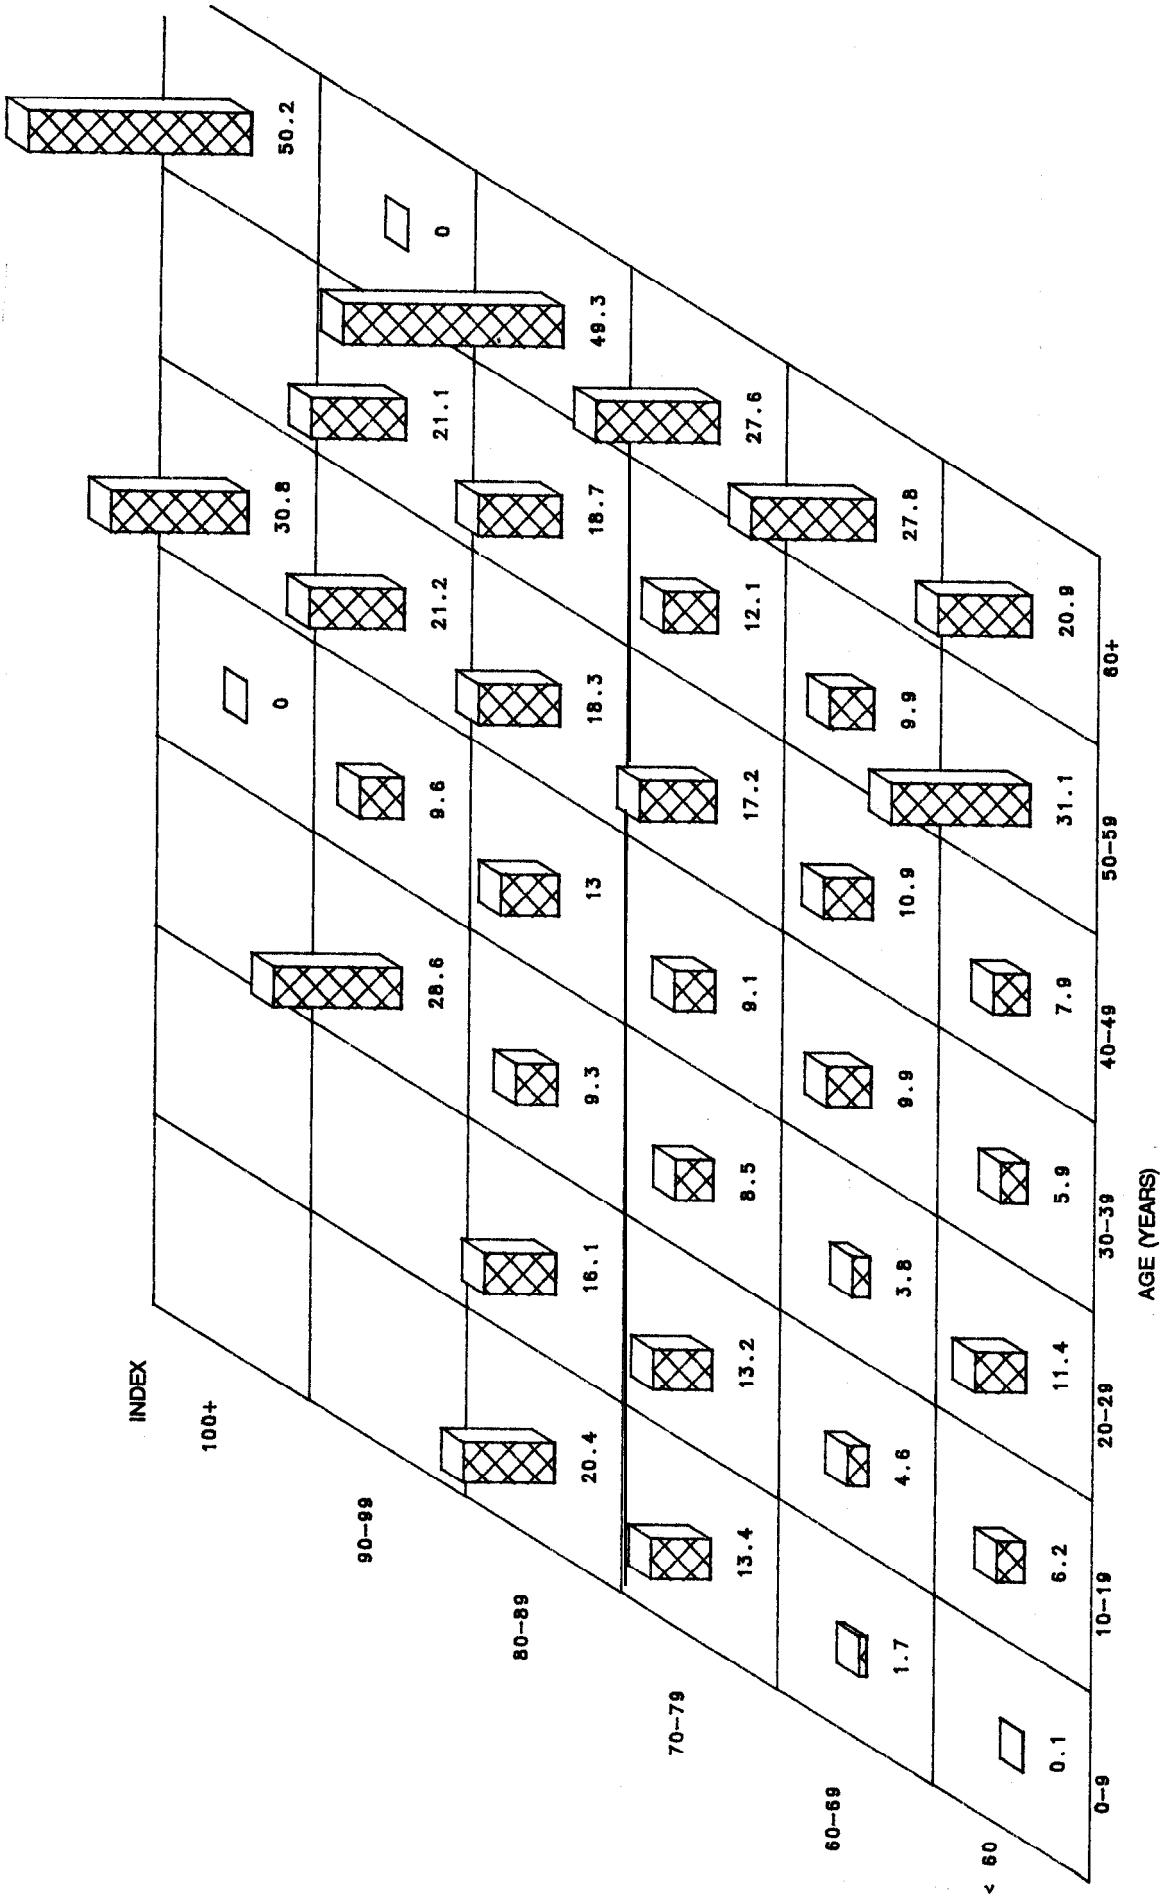

Figure 36C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, natural slash pine stands in Florida. (Represents 1,903,105 acres.)

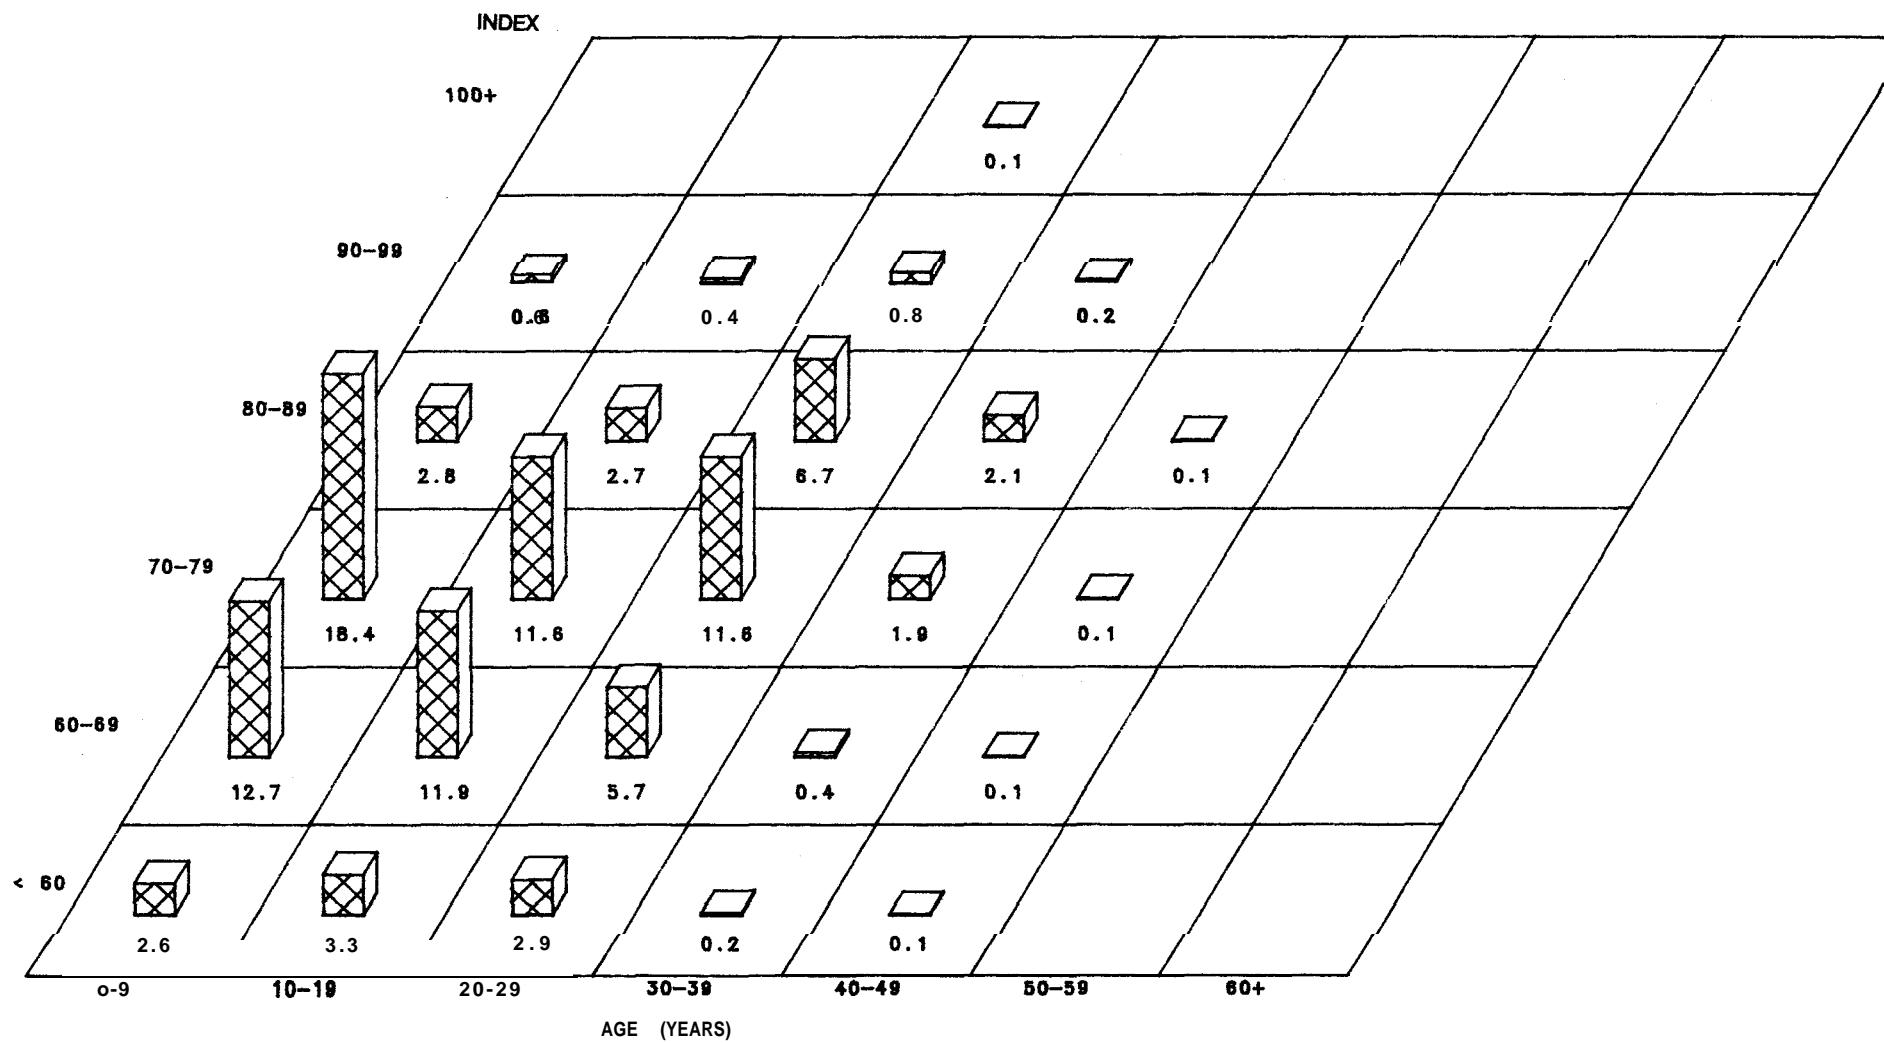

Figure 37A.—Percentage distribution of planted **slash** pine stands in Florida, by **site** index and **stand** age. (Represents 3,295,873 acres.)

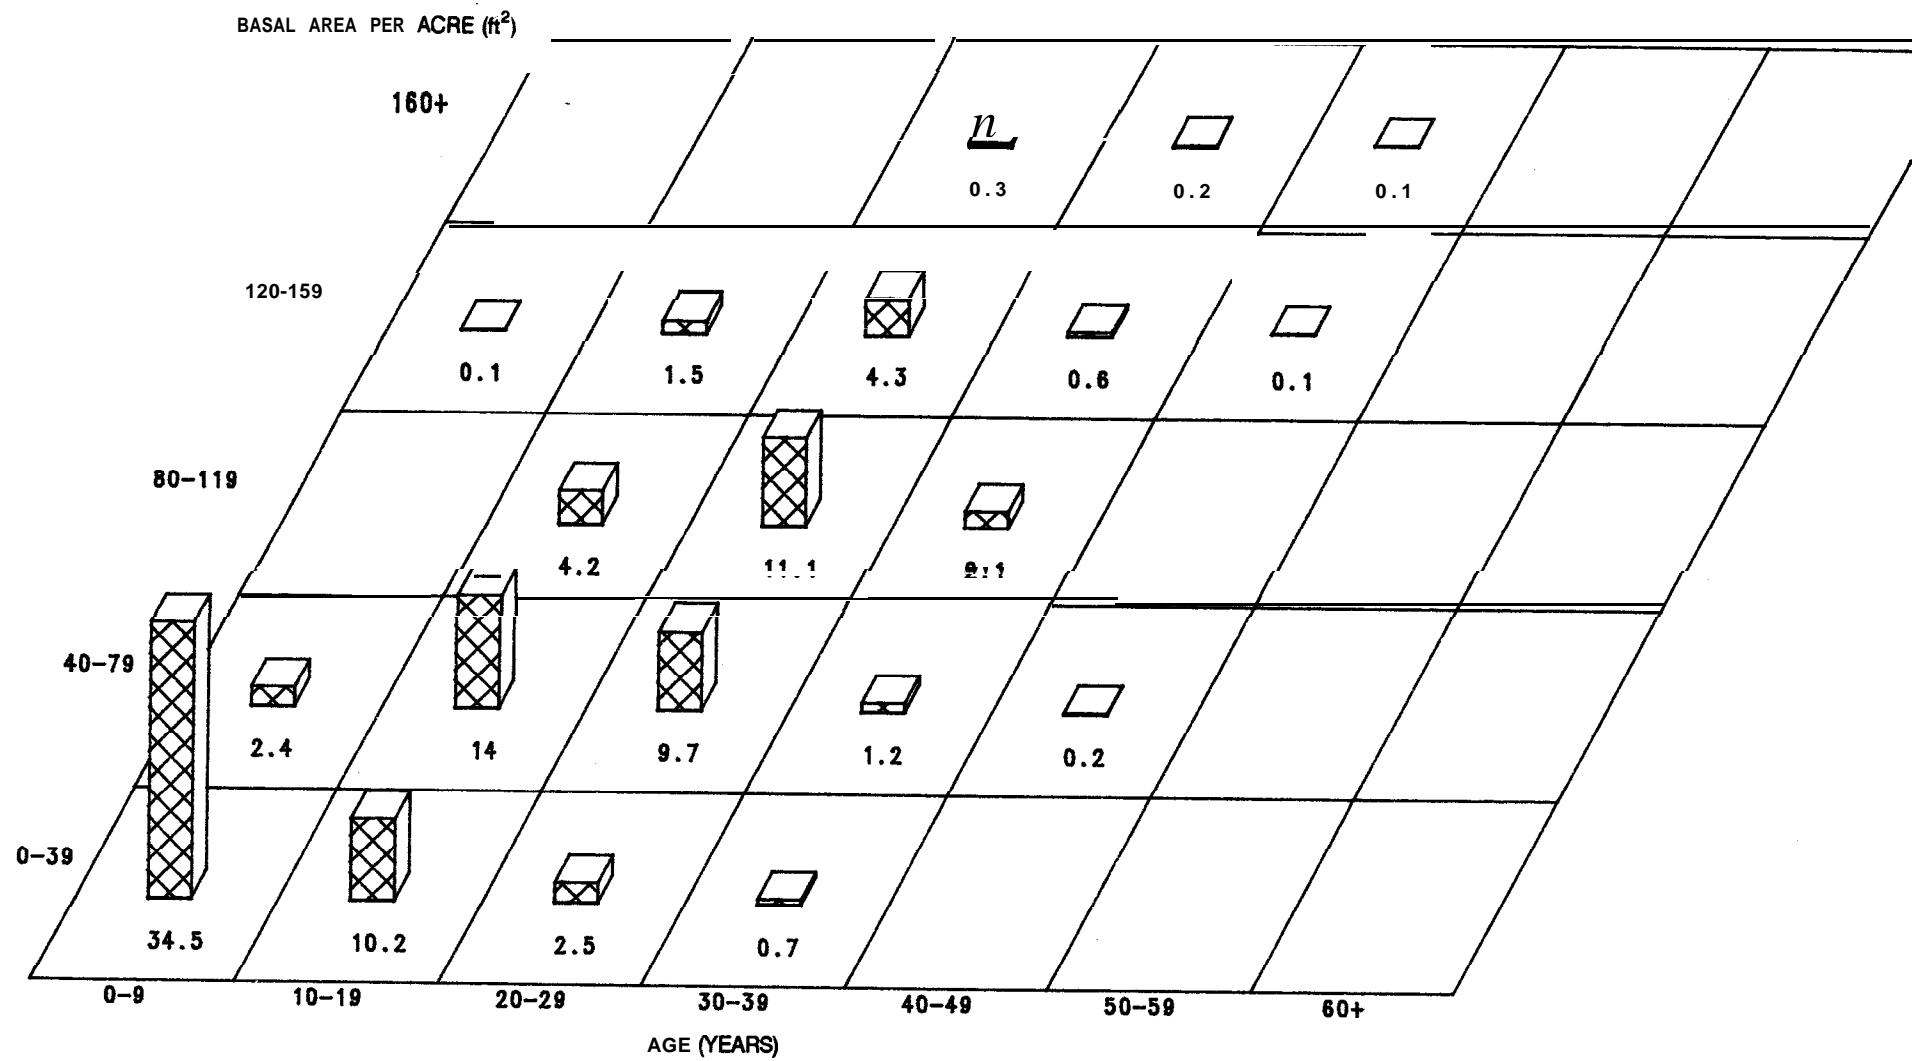

Figure 37B.—Percentage distribution of planted slash pine stands in Florida, by basal area per acre and stand age. (Represents 3,295,873 acres.)

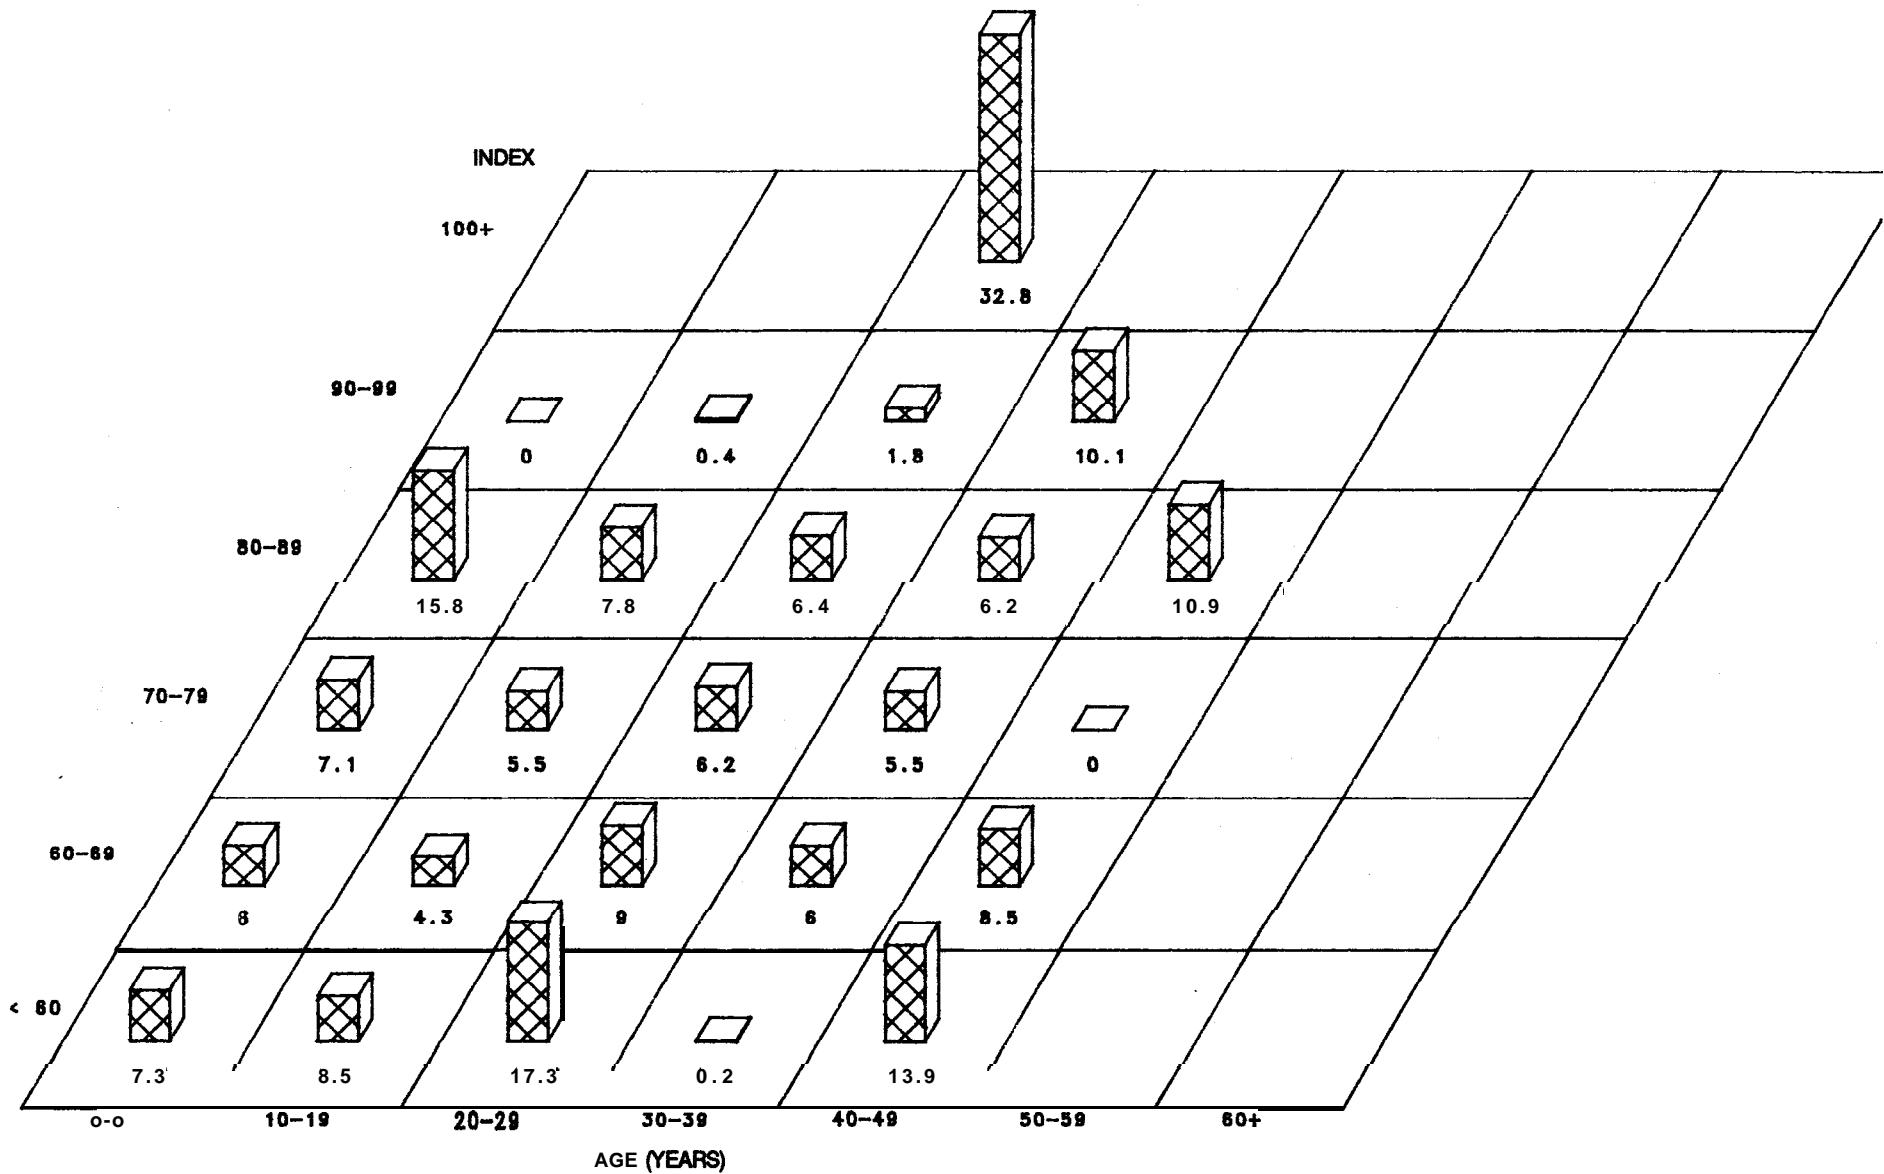

Figure 37C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for planted slash pine stands in Florida (Represents 3,295,873 acres.)

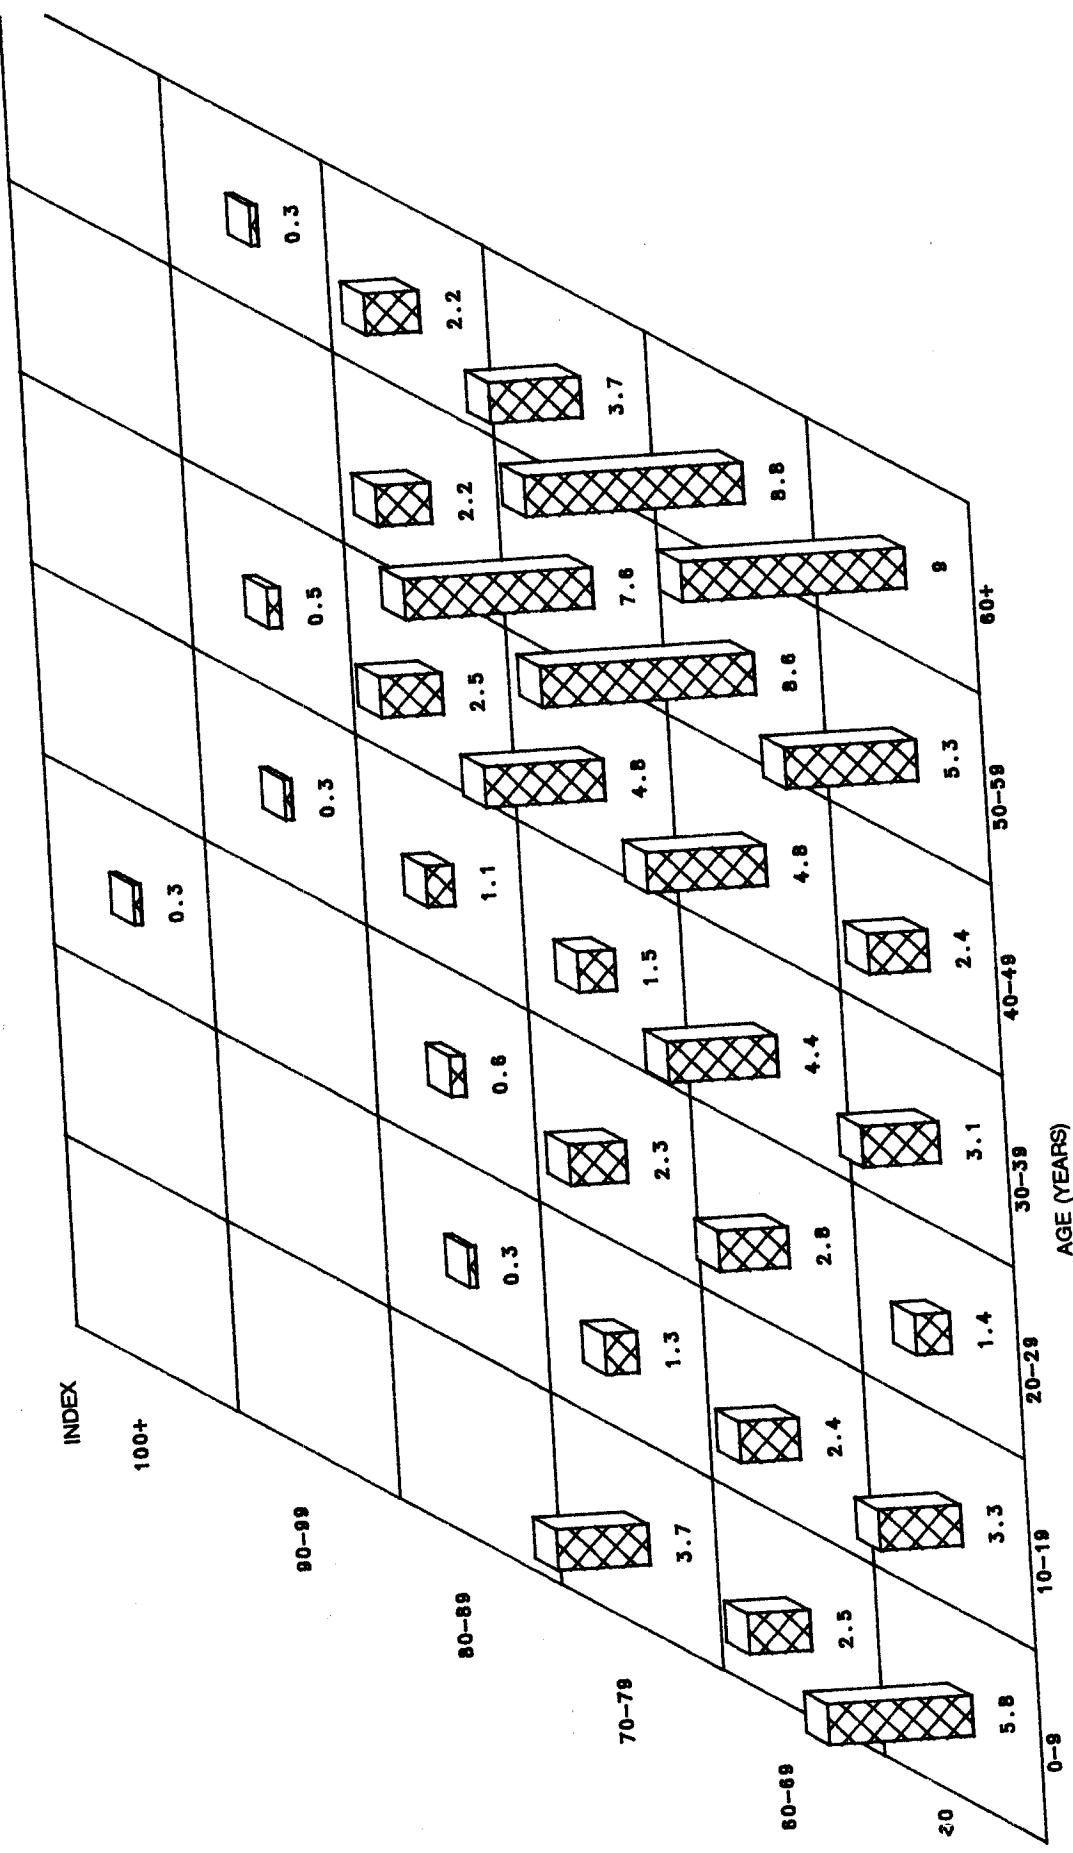

Figure 38A.—Percentage distribution of longleaf pine stands in Florida, by site index and stand age. (Represents 861,368 acres of natural stands, and 89,578 acres of planted stands.)

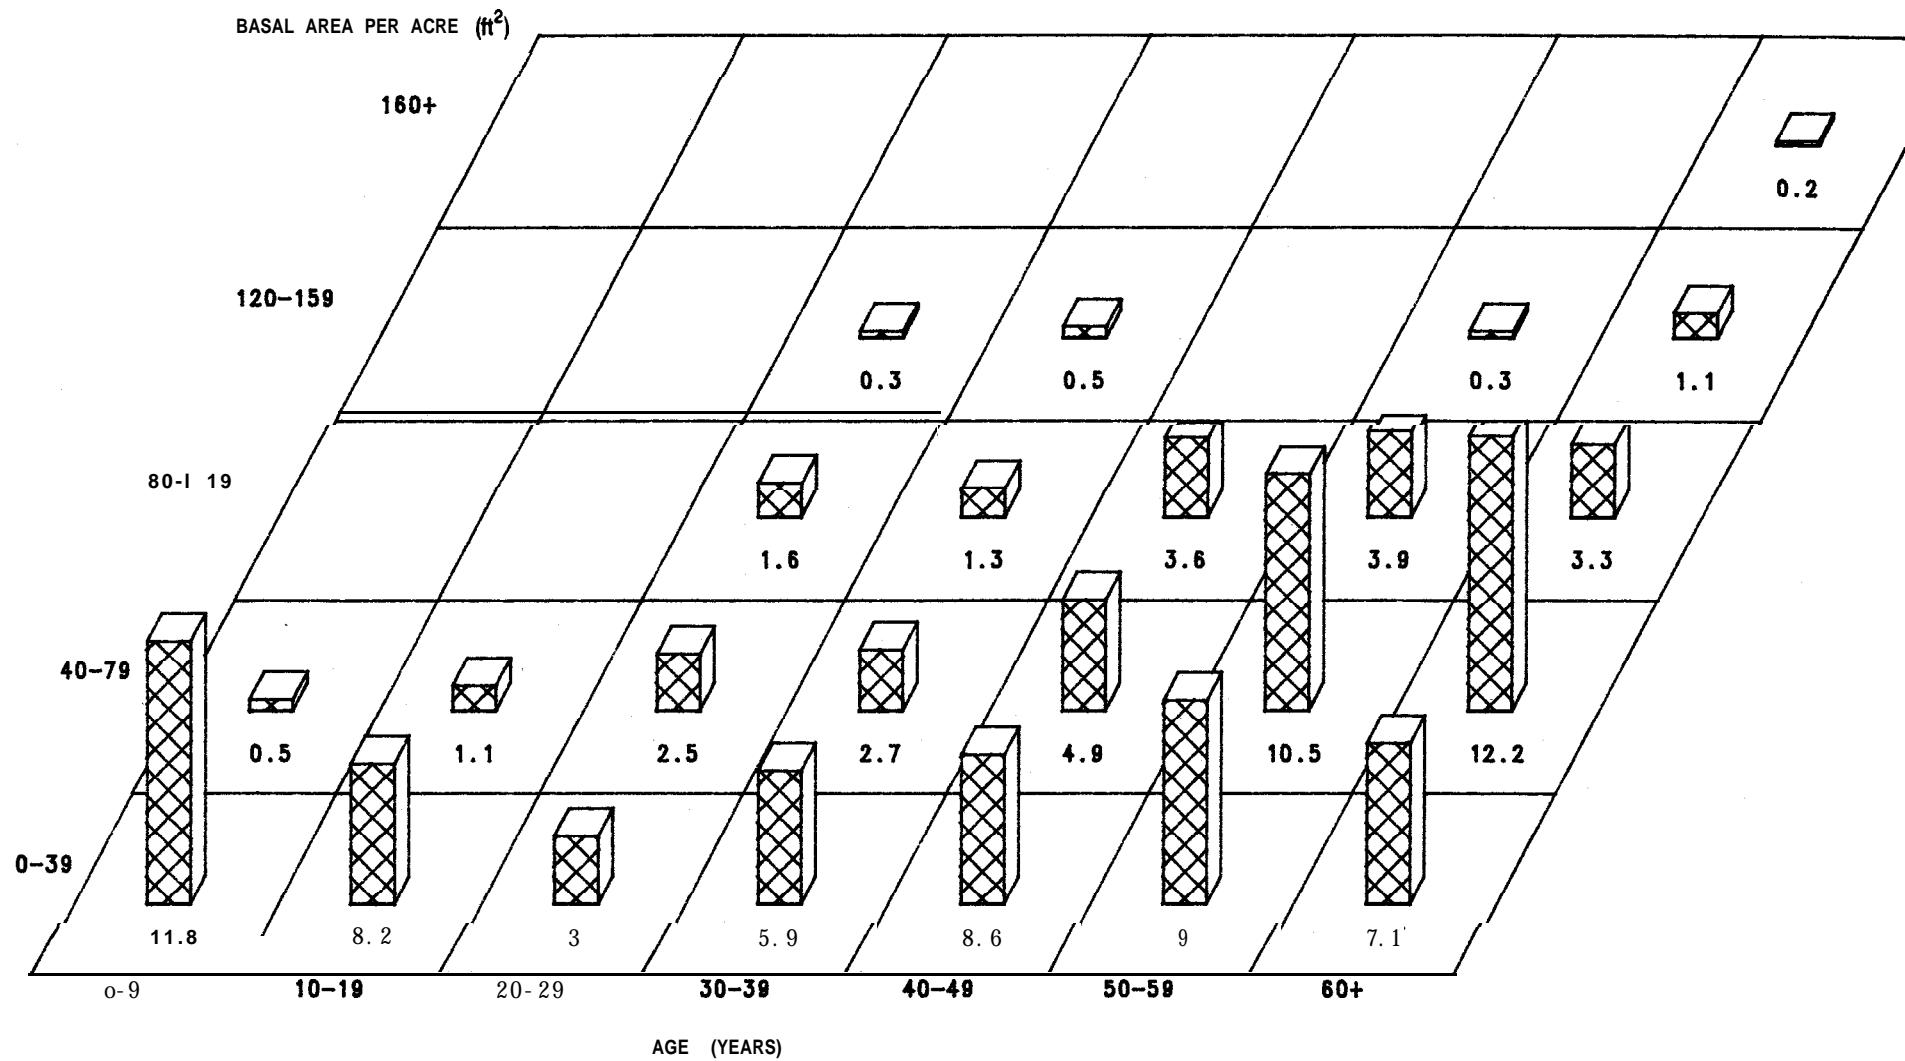

Figure 38B.—Percentage distribution of longleaf pine stands in Florida, by basal area per acre and stand age. (Represents 861,368 acres of natural stands, 89,578 acres of planted stands.)

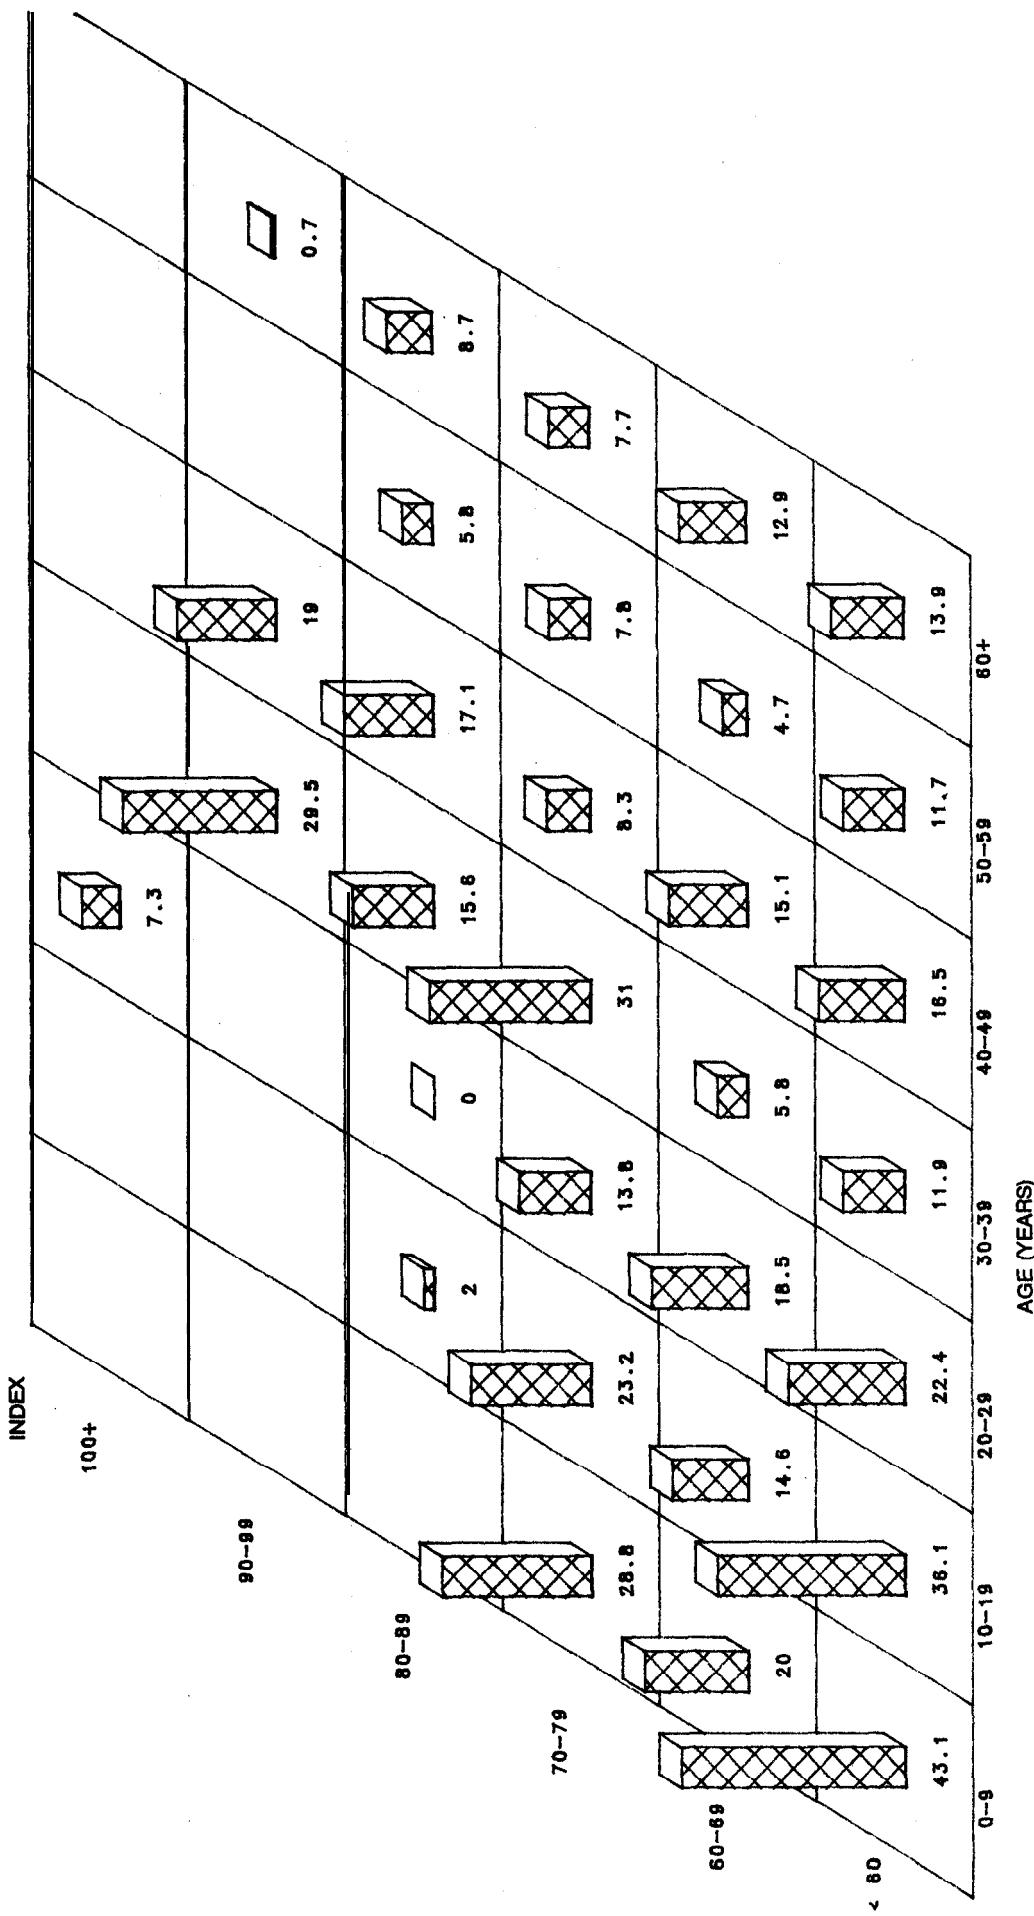

Figure 38C.—Percentage of basal area per acre in nonyellow-pine species, by site index and stand age, for longleaf pine stands in Florida. (Represents 861,368 acres of natural stands, and 89,578 acres of planted stands.)

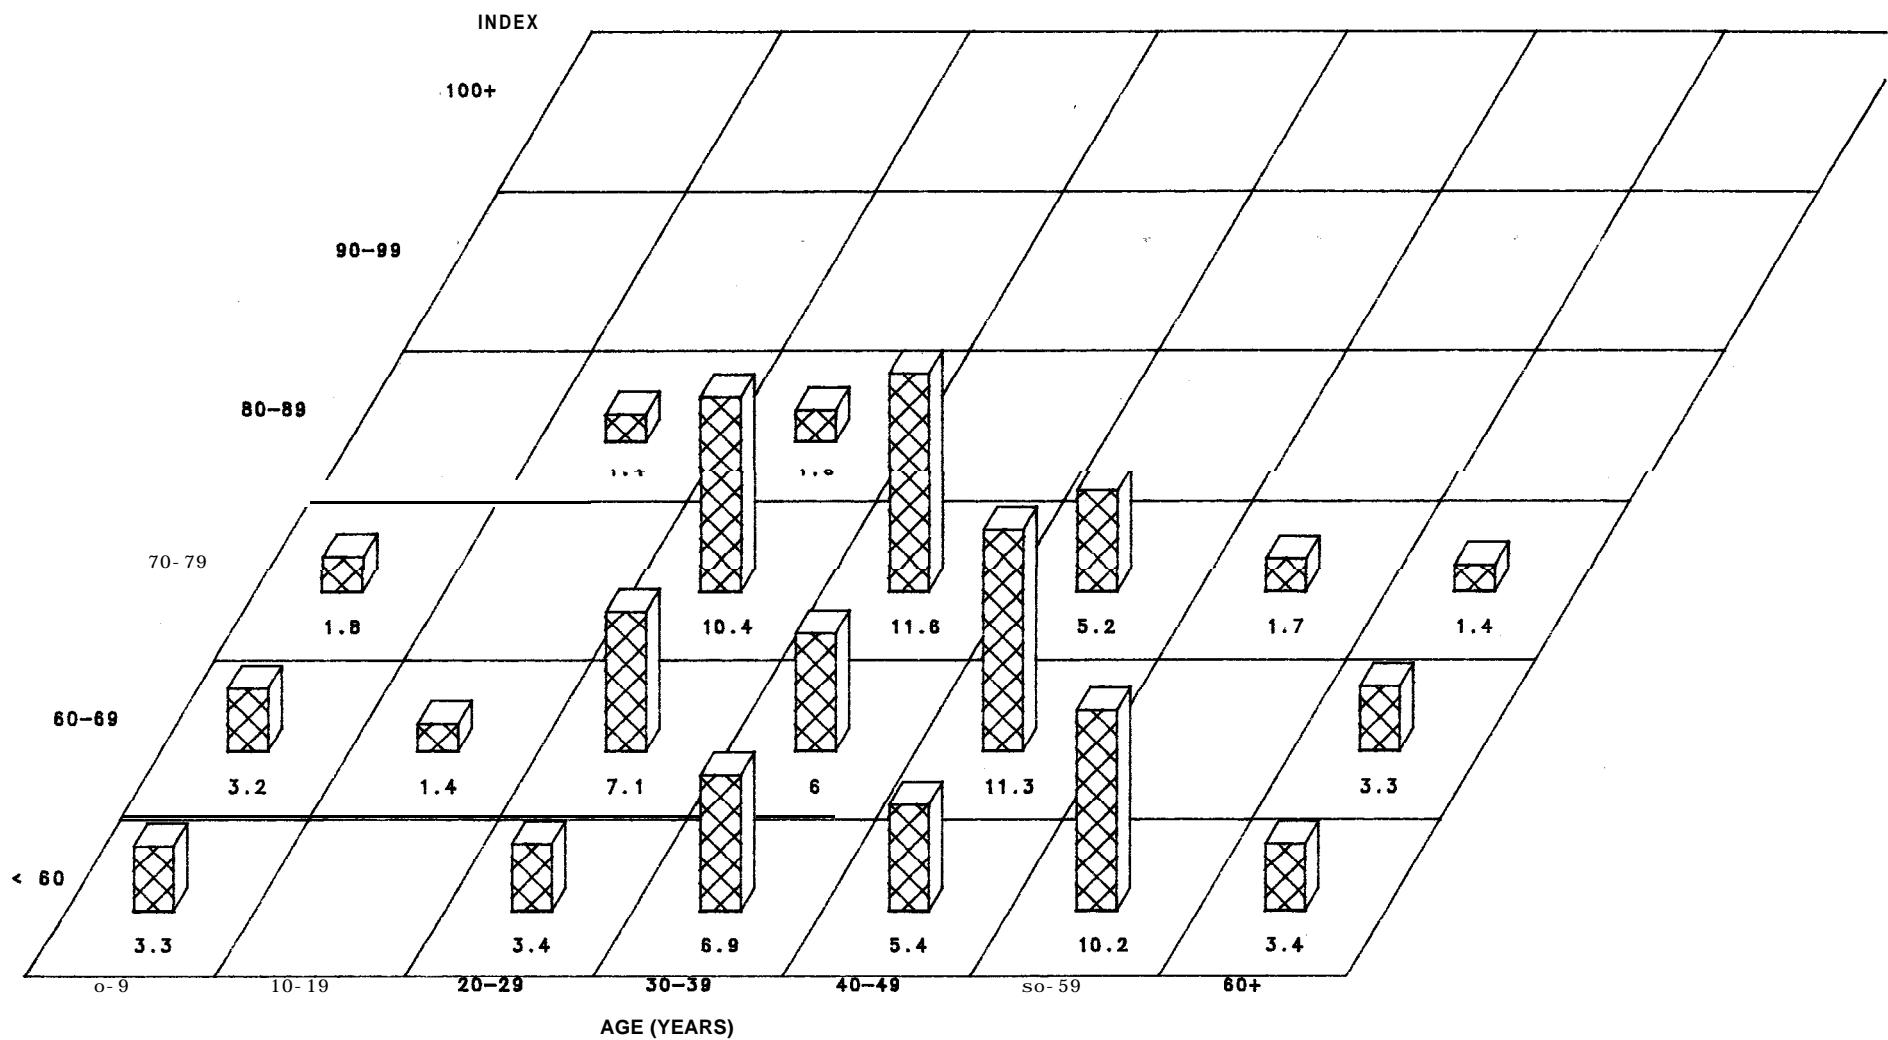

Figure 39A.—Percentage distribution of pond pine stands in Florida, by site index and stand age. (Represents 157,533 acres of natural stands.)

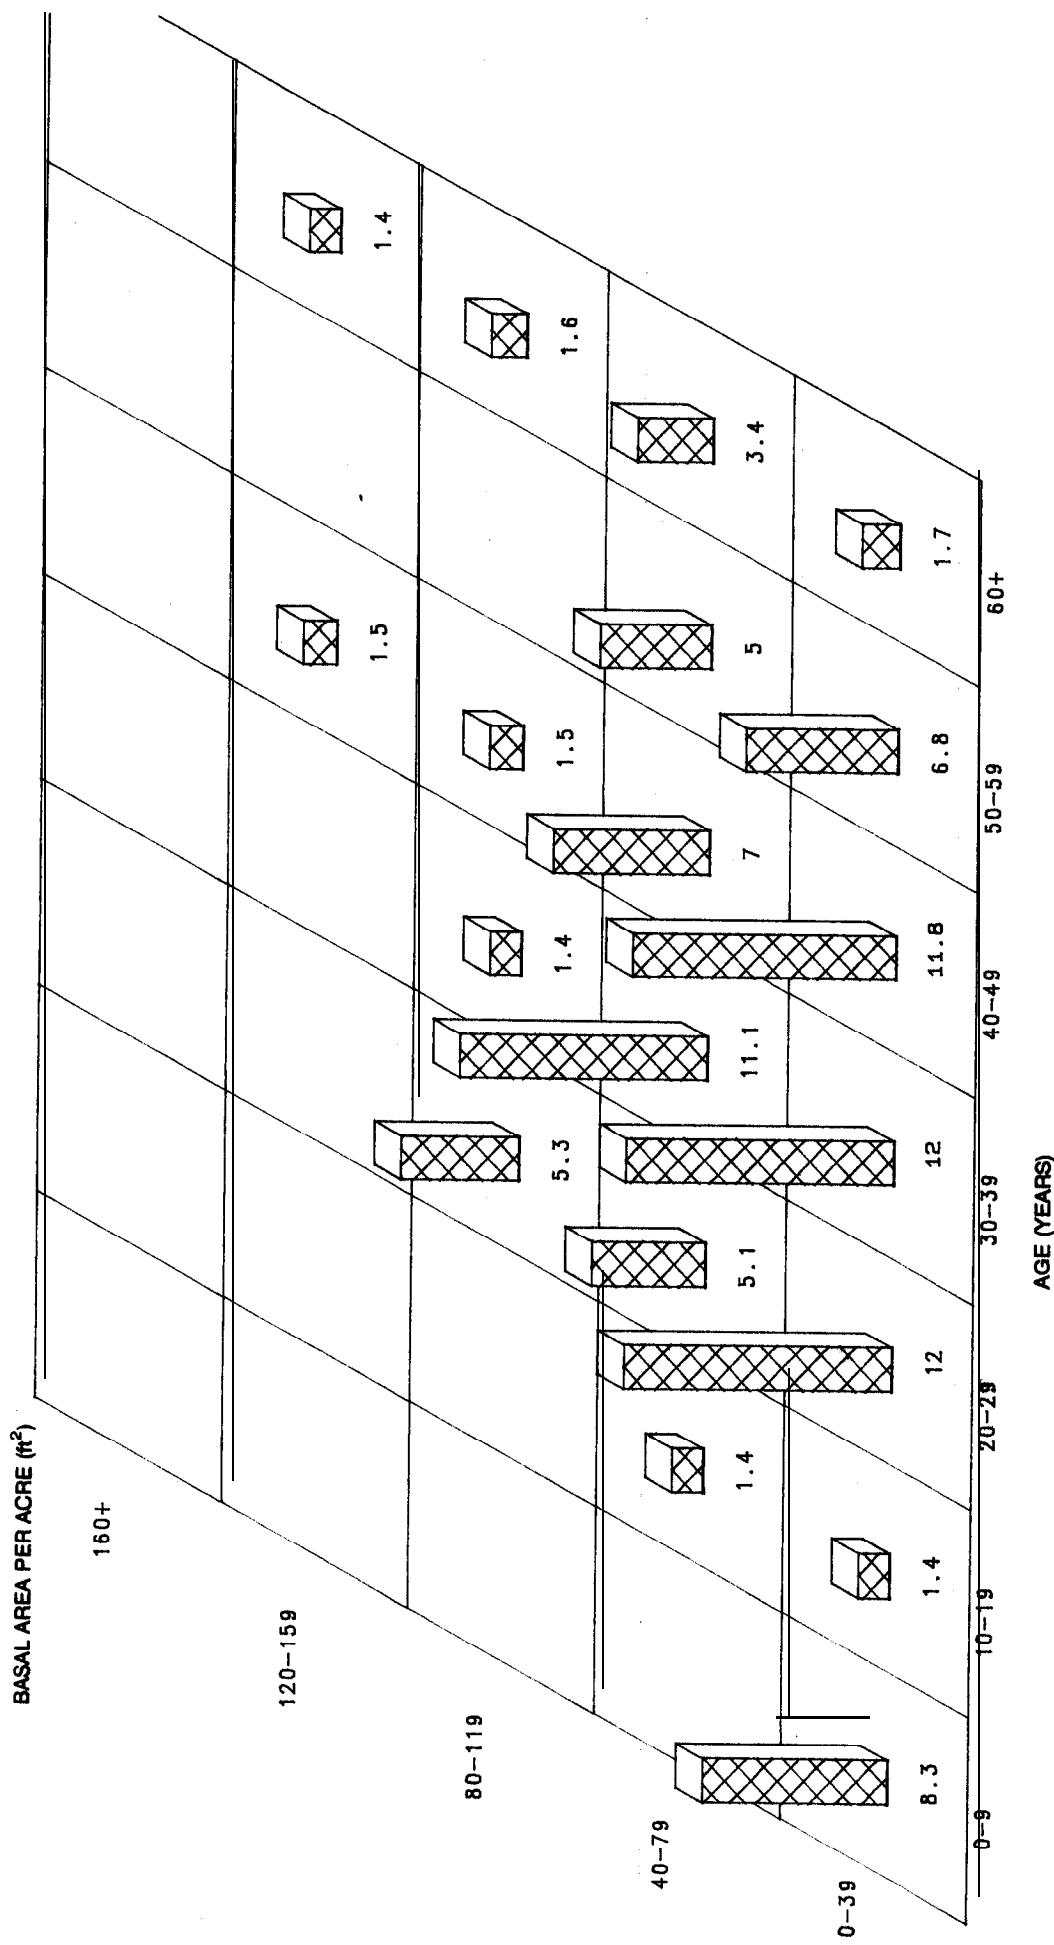

Figure 39B.—Percentage distribution of pond pine stands in Florida, by basal area per acre and stand age. (Represents 157,833 acres of natural stands.)

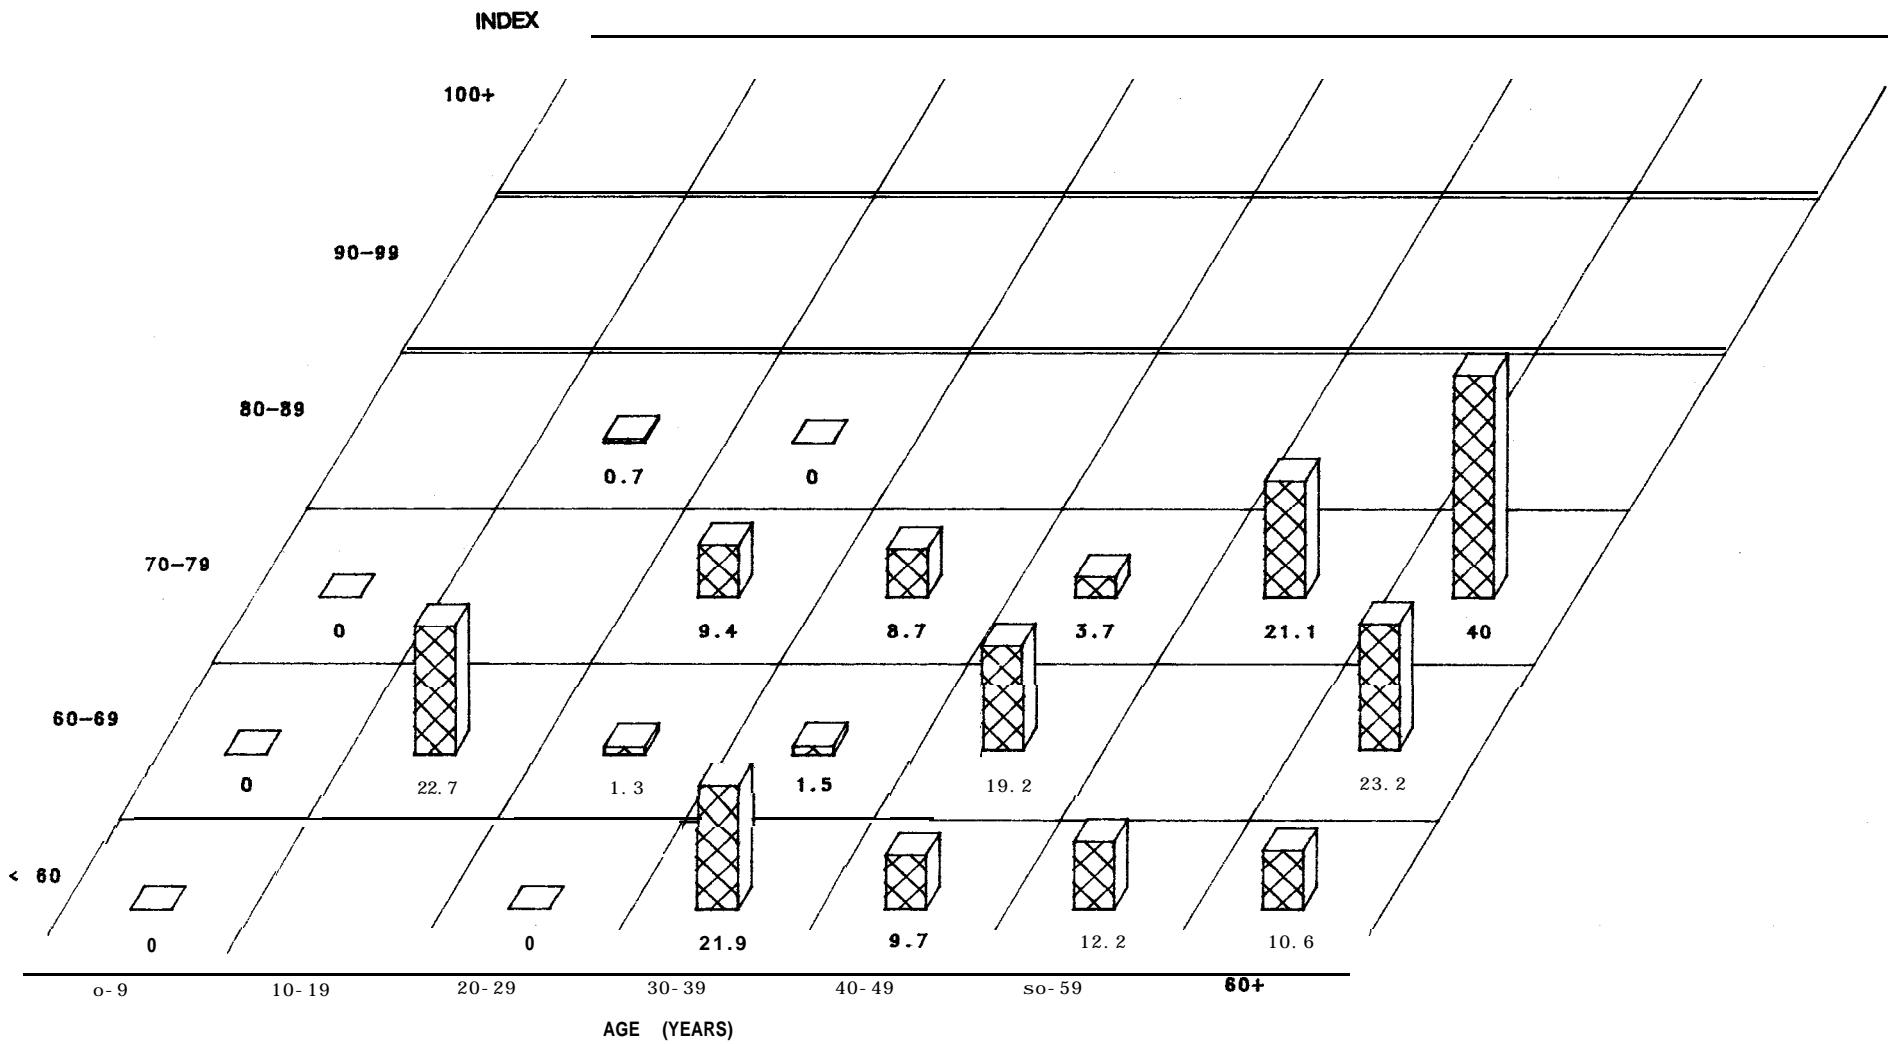

Figure 39C.—Percentage of basal area per acre in **non-yellow-pine** species, by site index and stand age, for pond pine stands in Florida.
(Represents 157,833 acres of natural stands.)

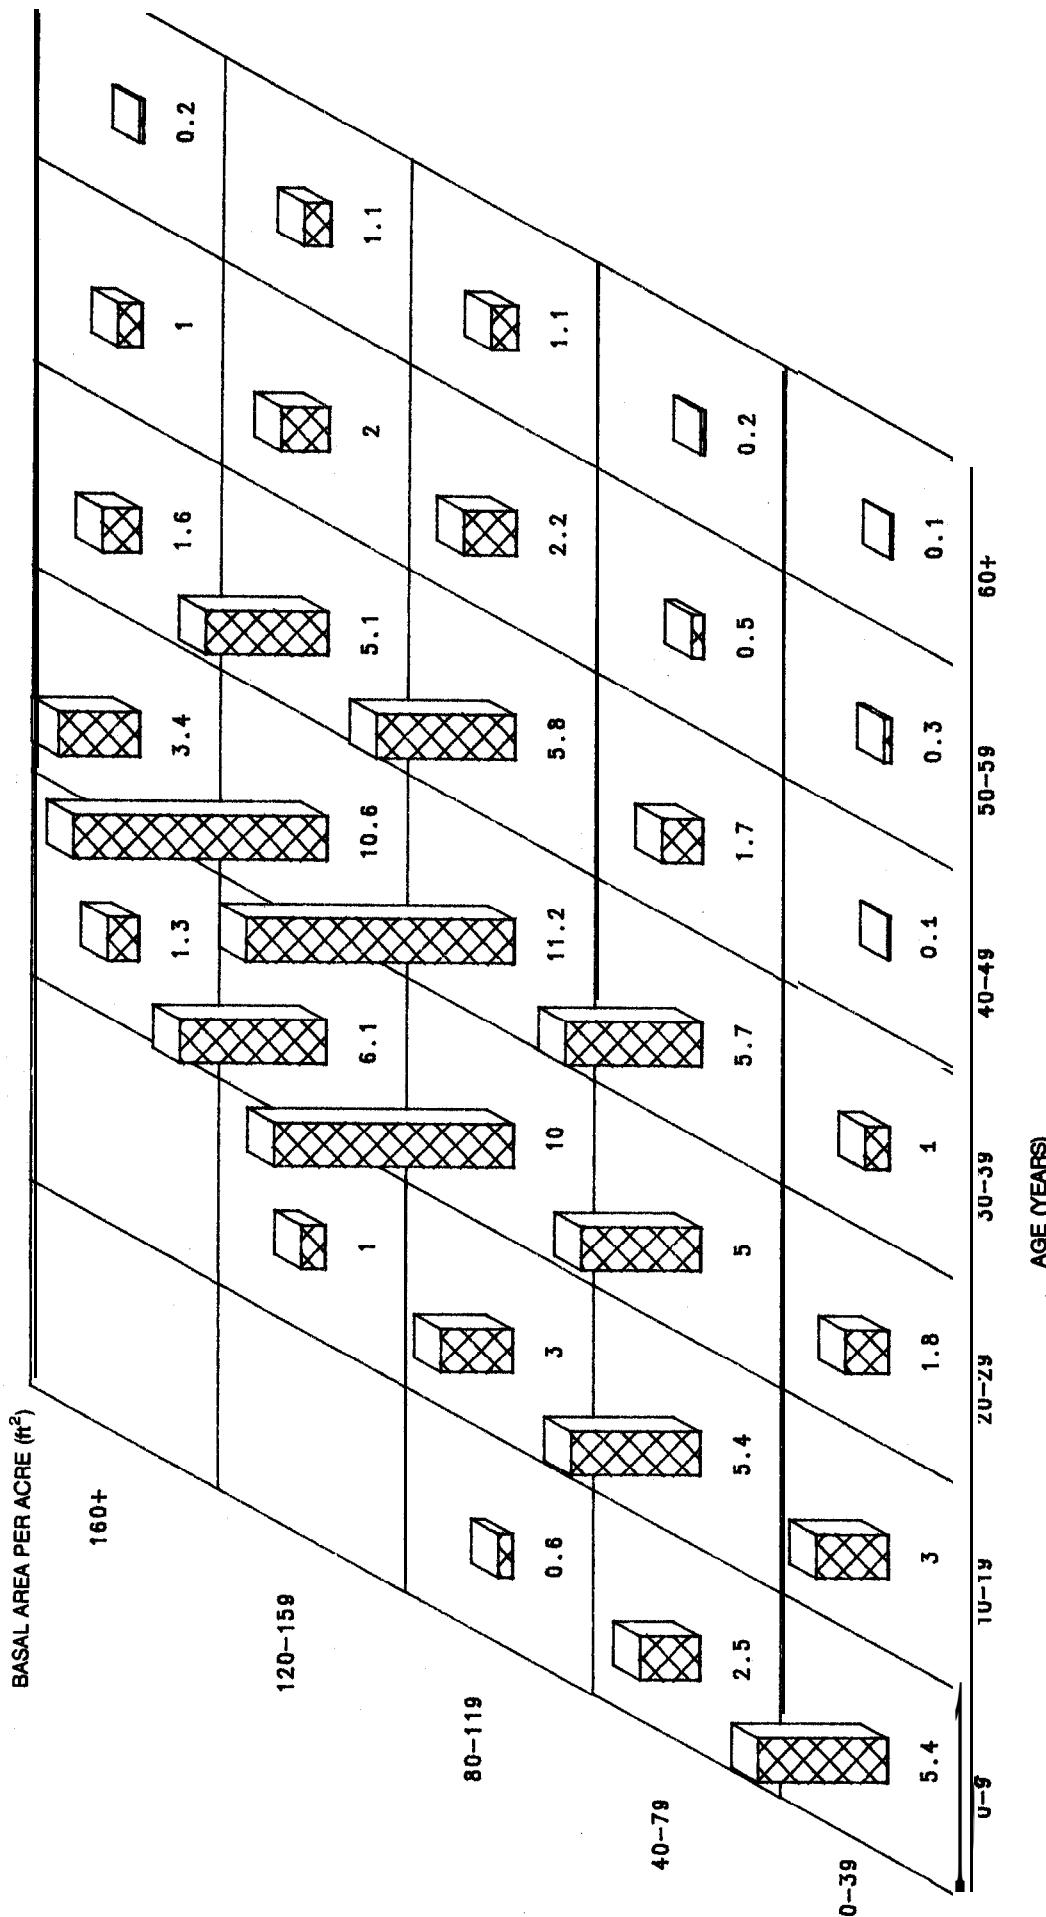

Figure 40.—Percentage distribution of natural loblolly pine stands in Georgia, by basal area per acre and stand age. (Represents 3,757,124 acres.)

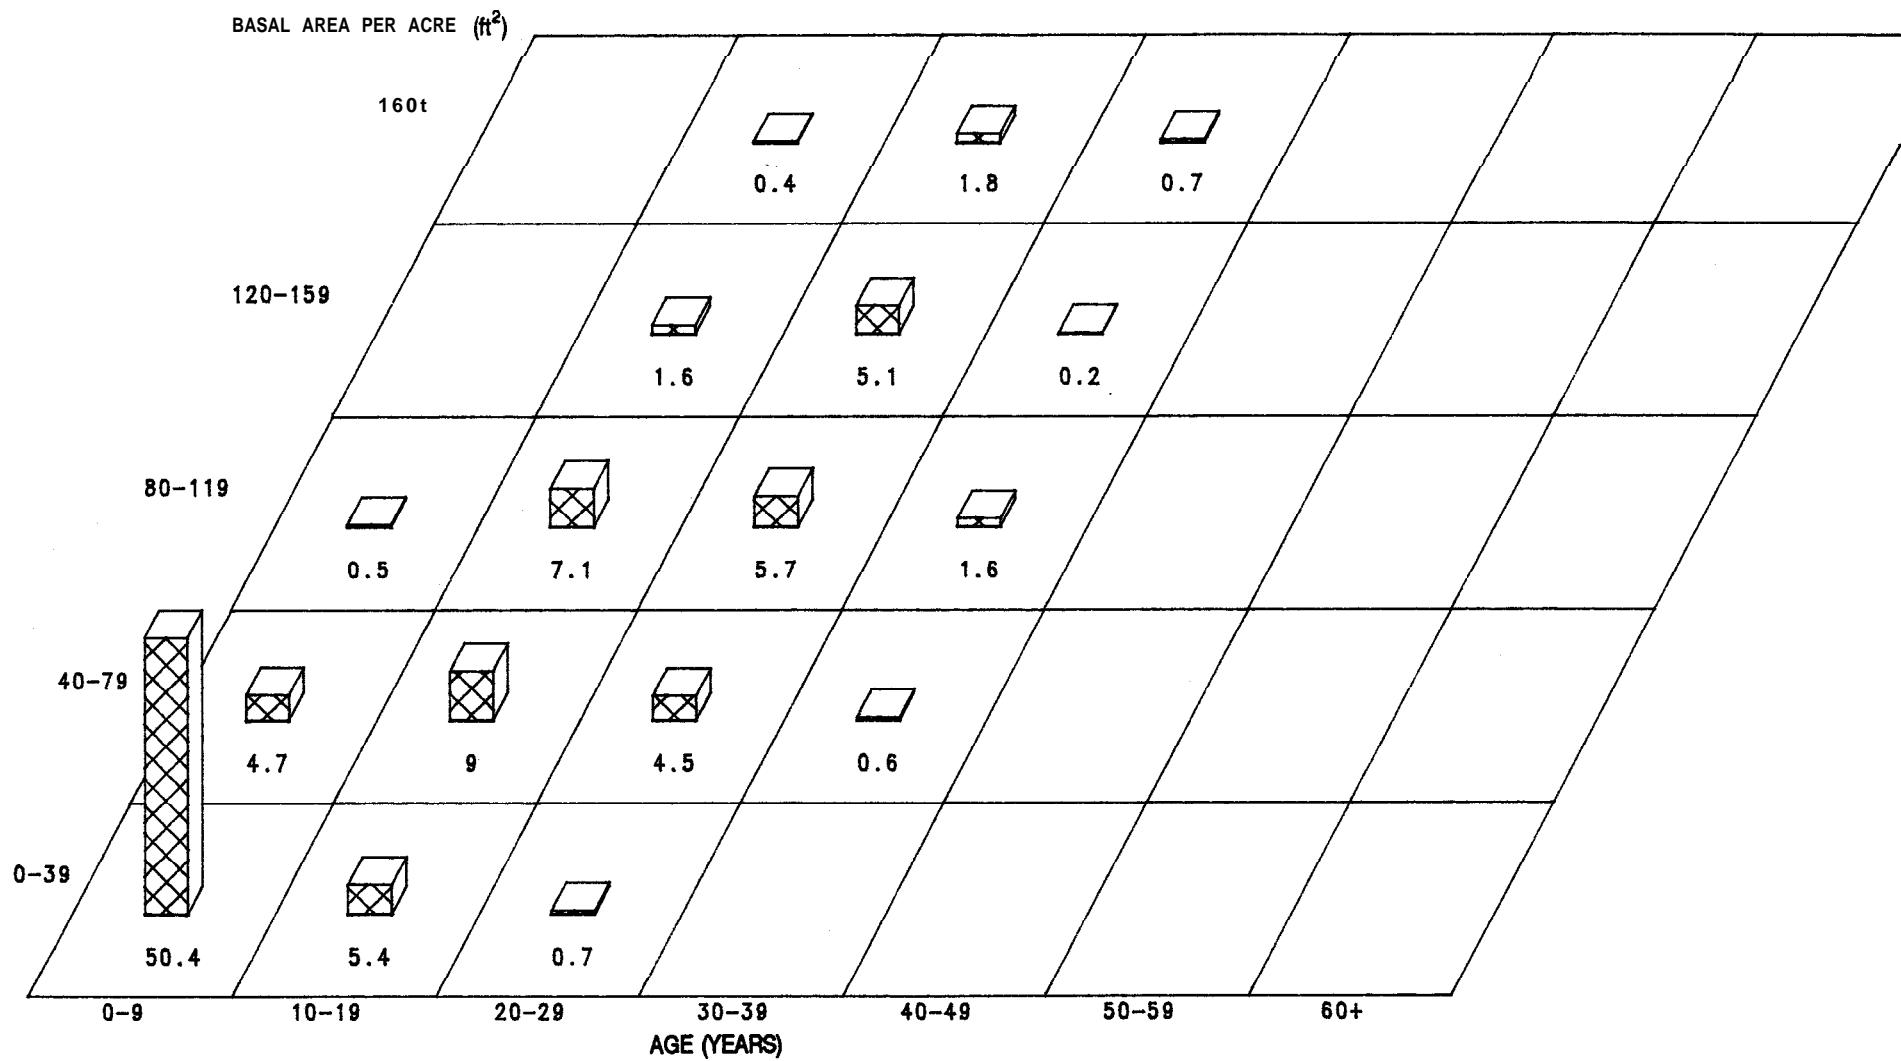

Figure 41.-Percentage distribution of planted loblolly pine stands in Georgia, by basal area per acre and stand age. (Represents 1373,109 acres.)

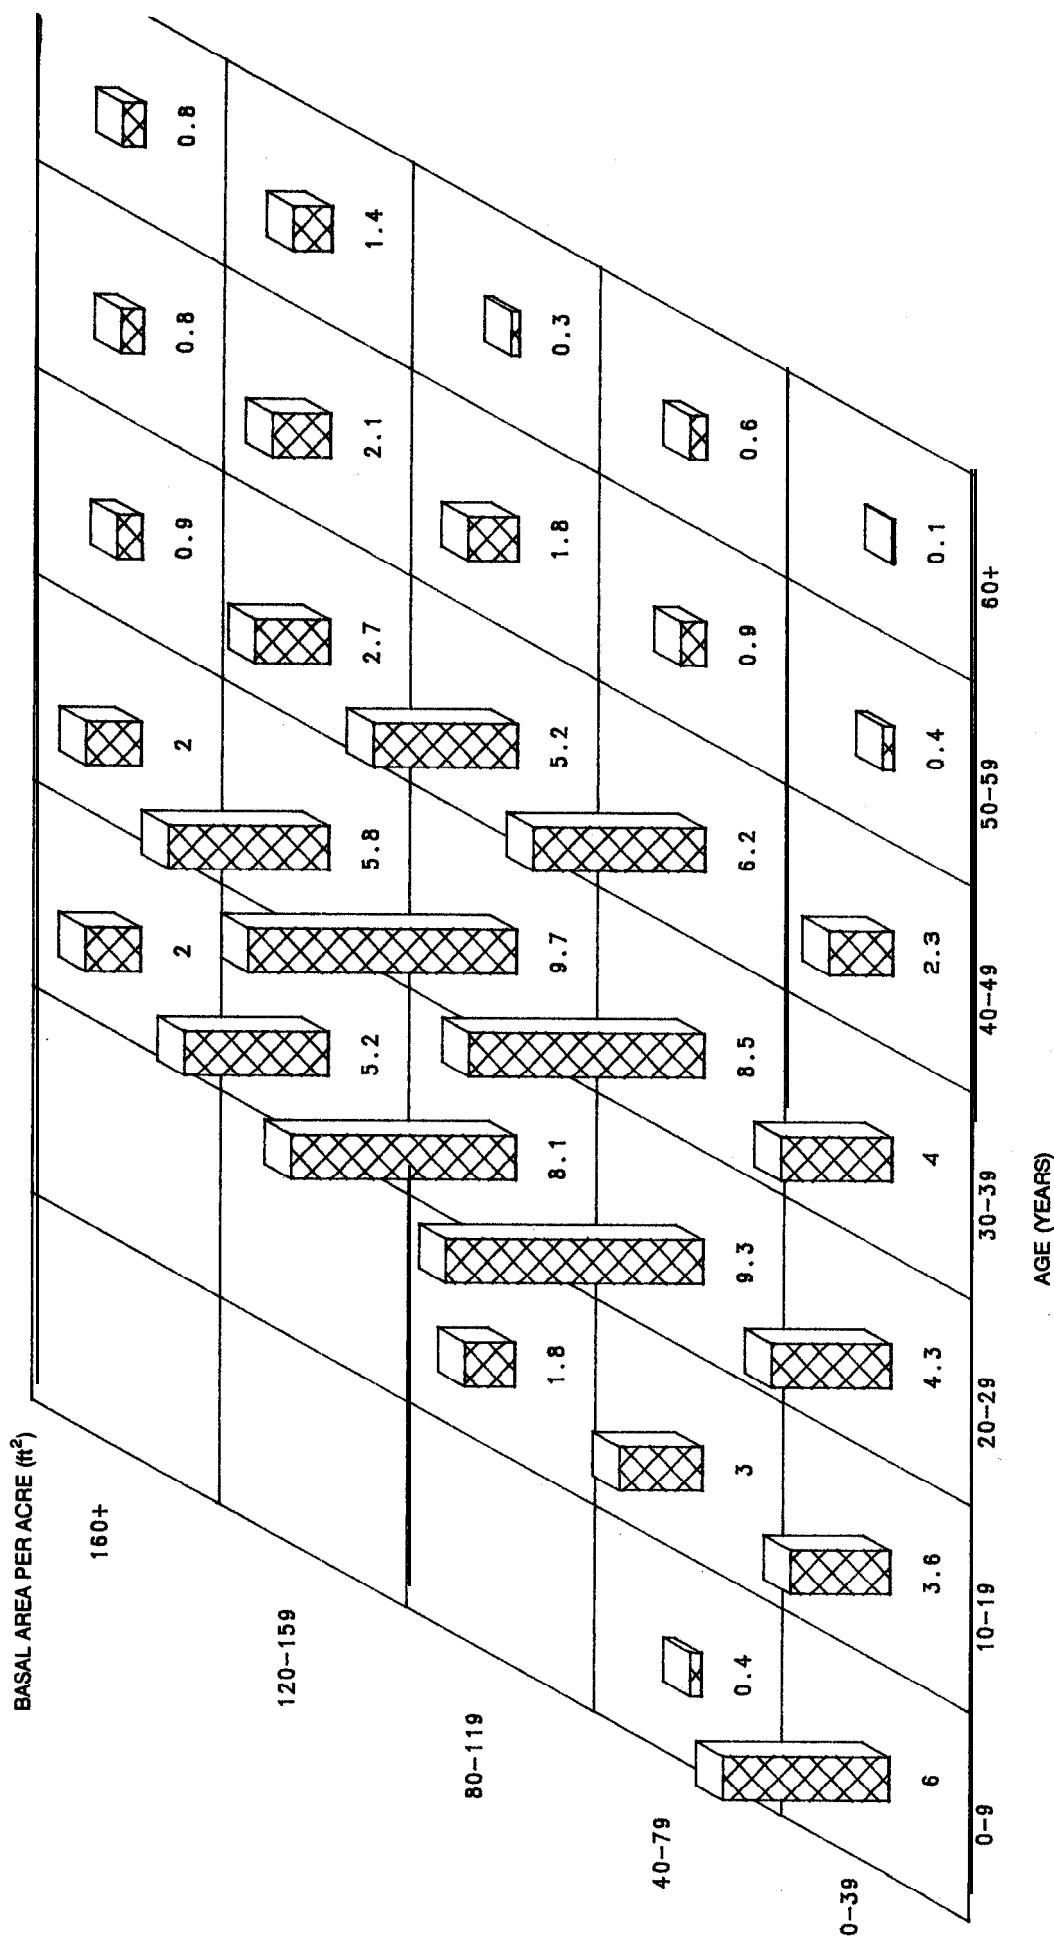

Figure 42.—Percentage distribution of natural slash pine stands in Georgia, by basal area per acre and stand age. (Represents 1,897,060 acres.)

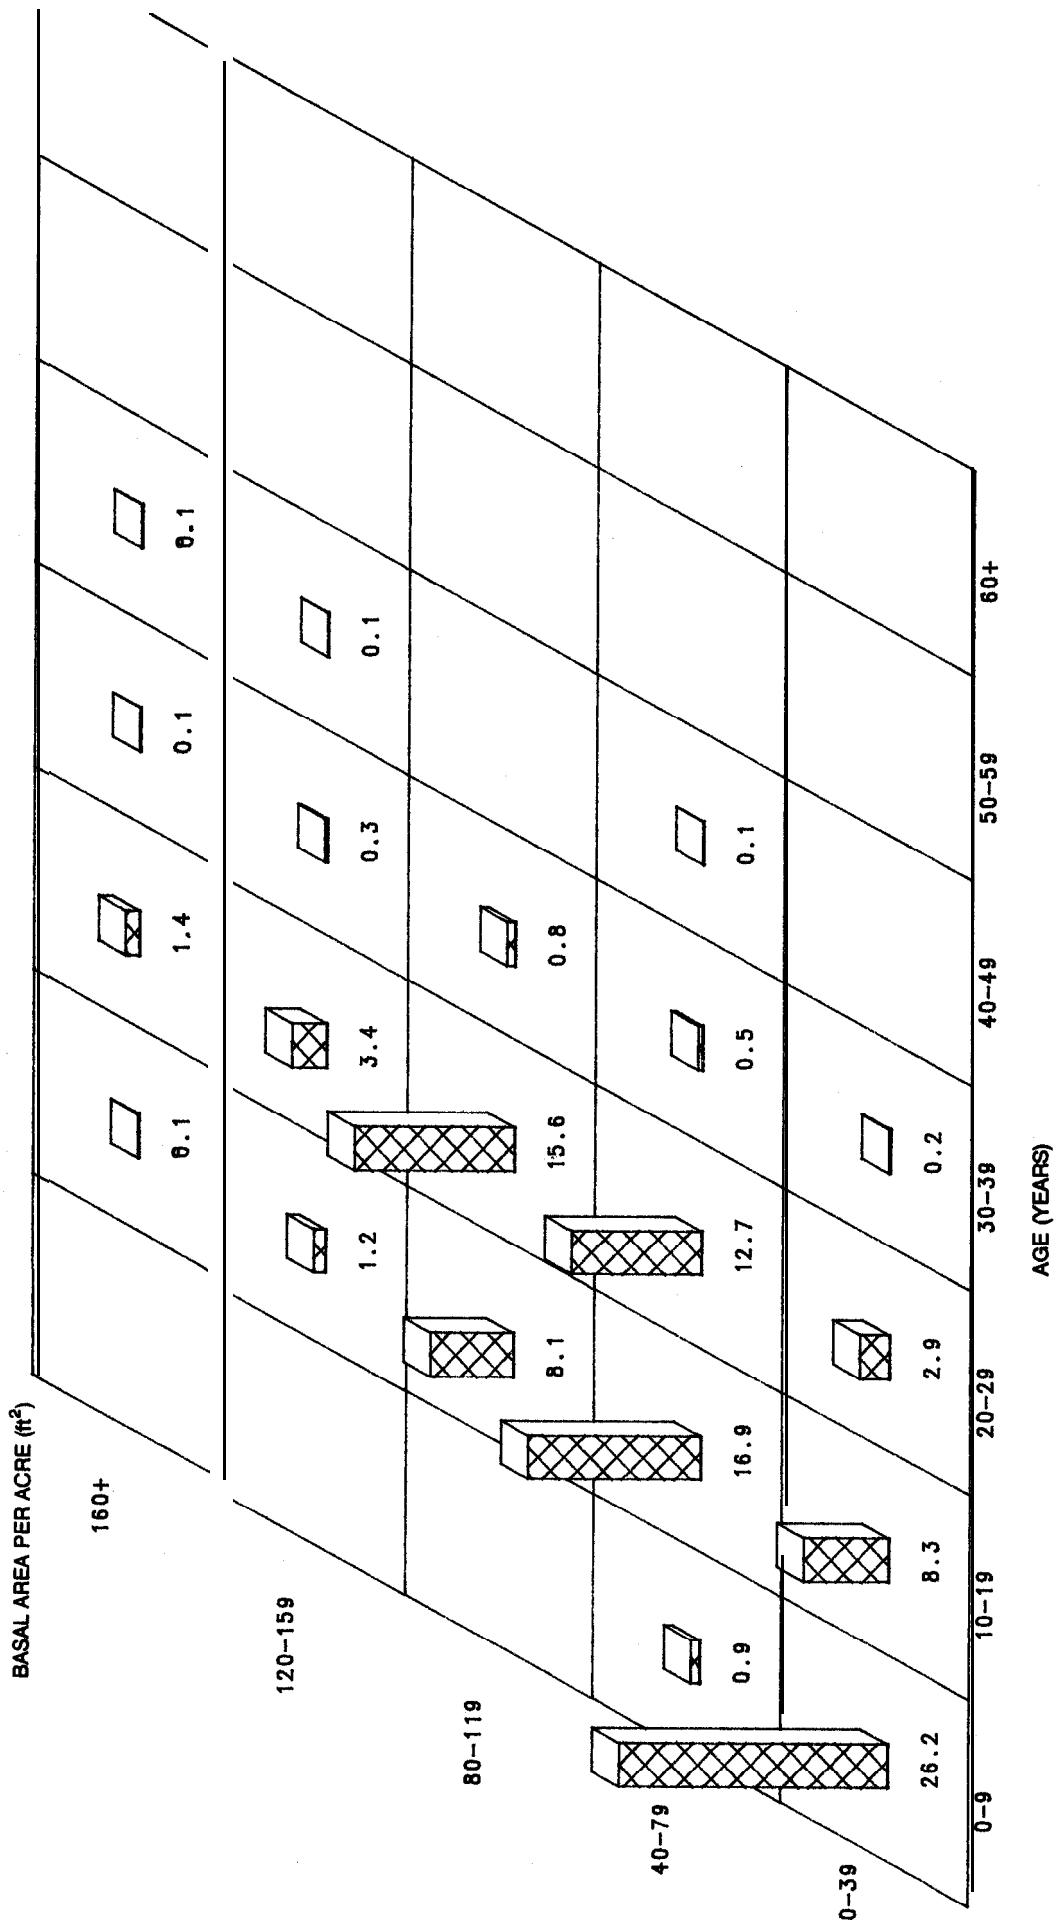

Figure 43.—Percentage distribution of planted slash pine stands in Georgia, by basal area per acre and stand age. (Represents 2,160,706 acres.)

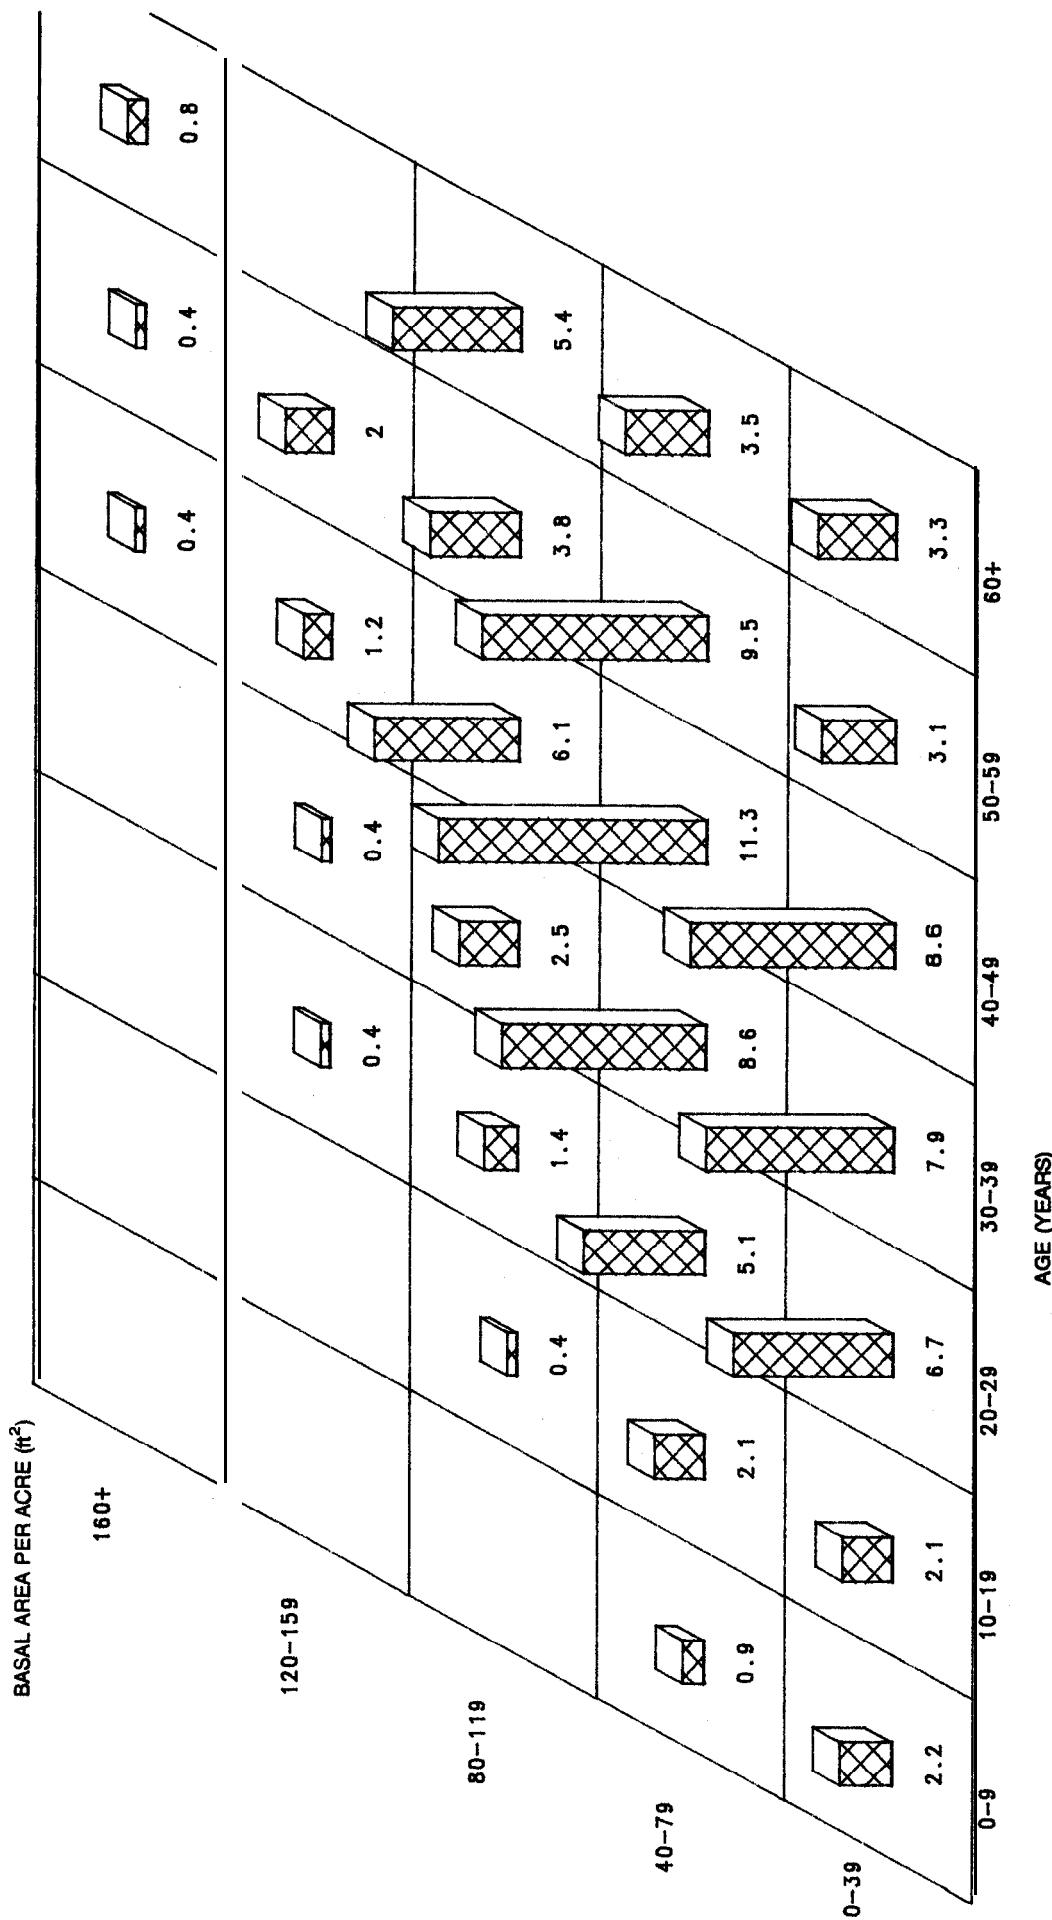

Figure 44.—Percentage distribution of longleaf pine stands in Georgia, by basal area and stand age. (Represents 665,371 acres of natural stands, and 11,073 acres of planted stands.)

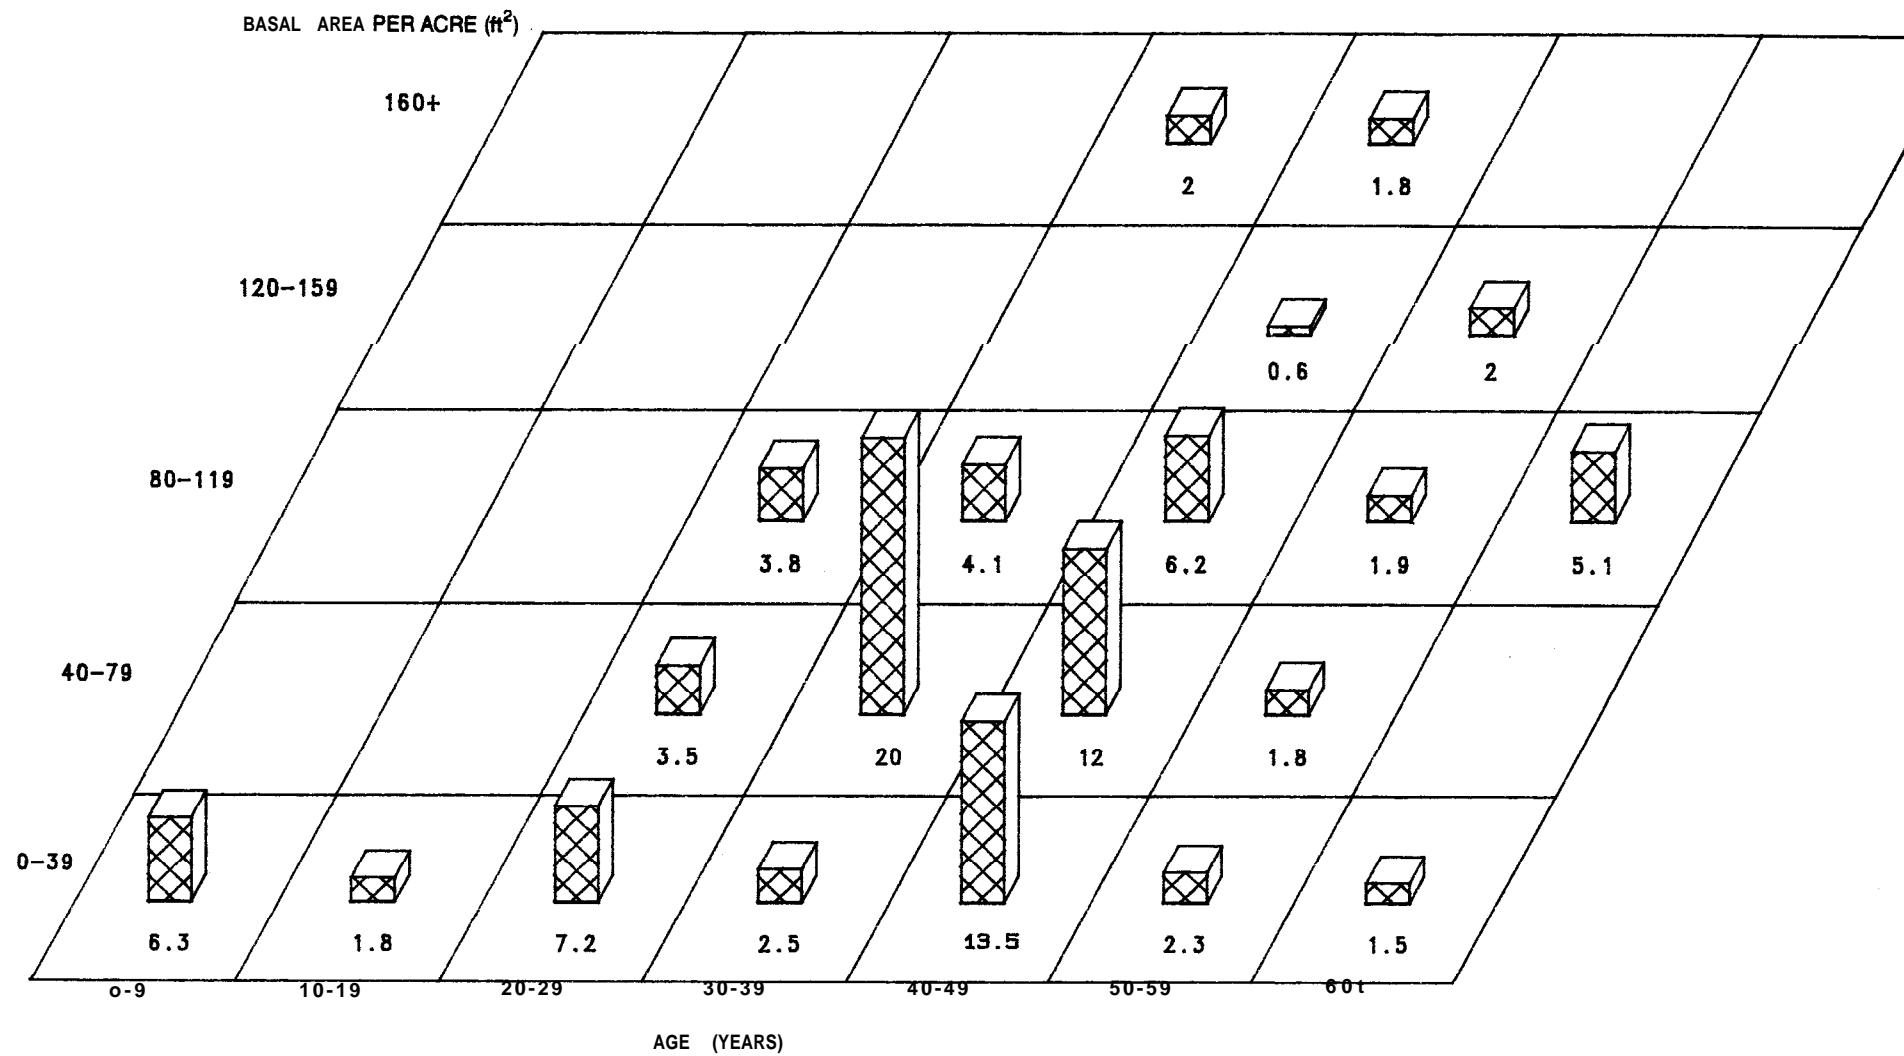

Figure 45.—Percentage distribution of pond pine stands in Georgia, by basal area per acre and stand age. (Represents 138,673 acres of natural stands, and 2,575 acres of planted stands.)

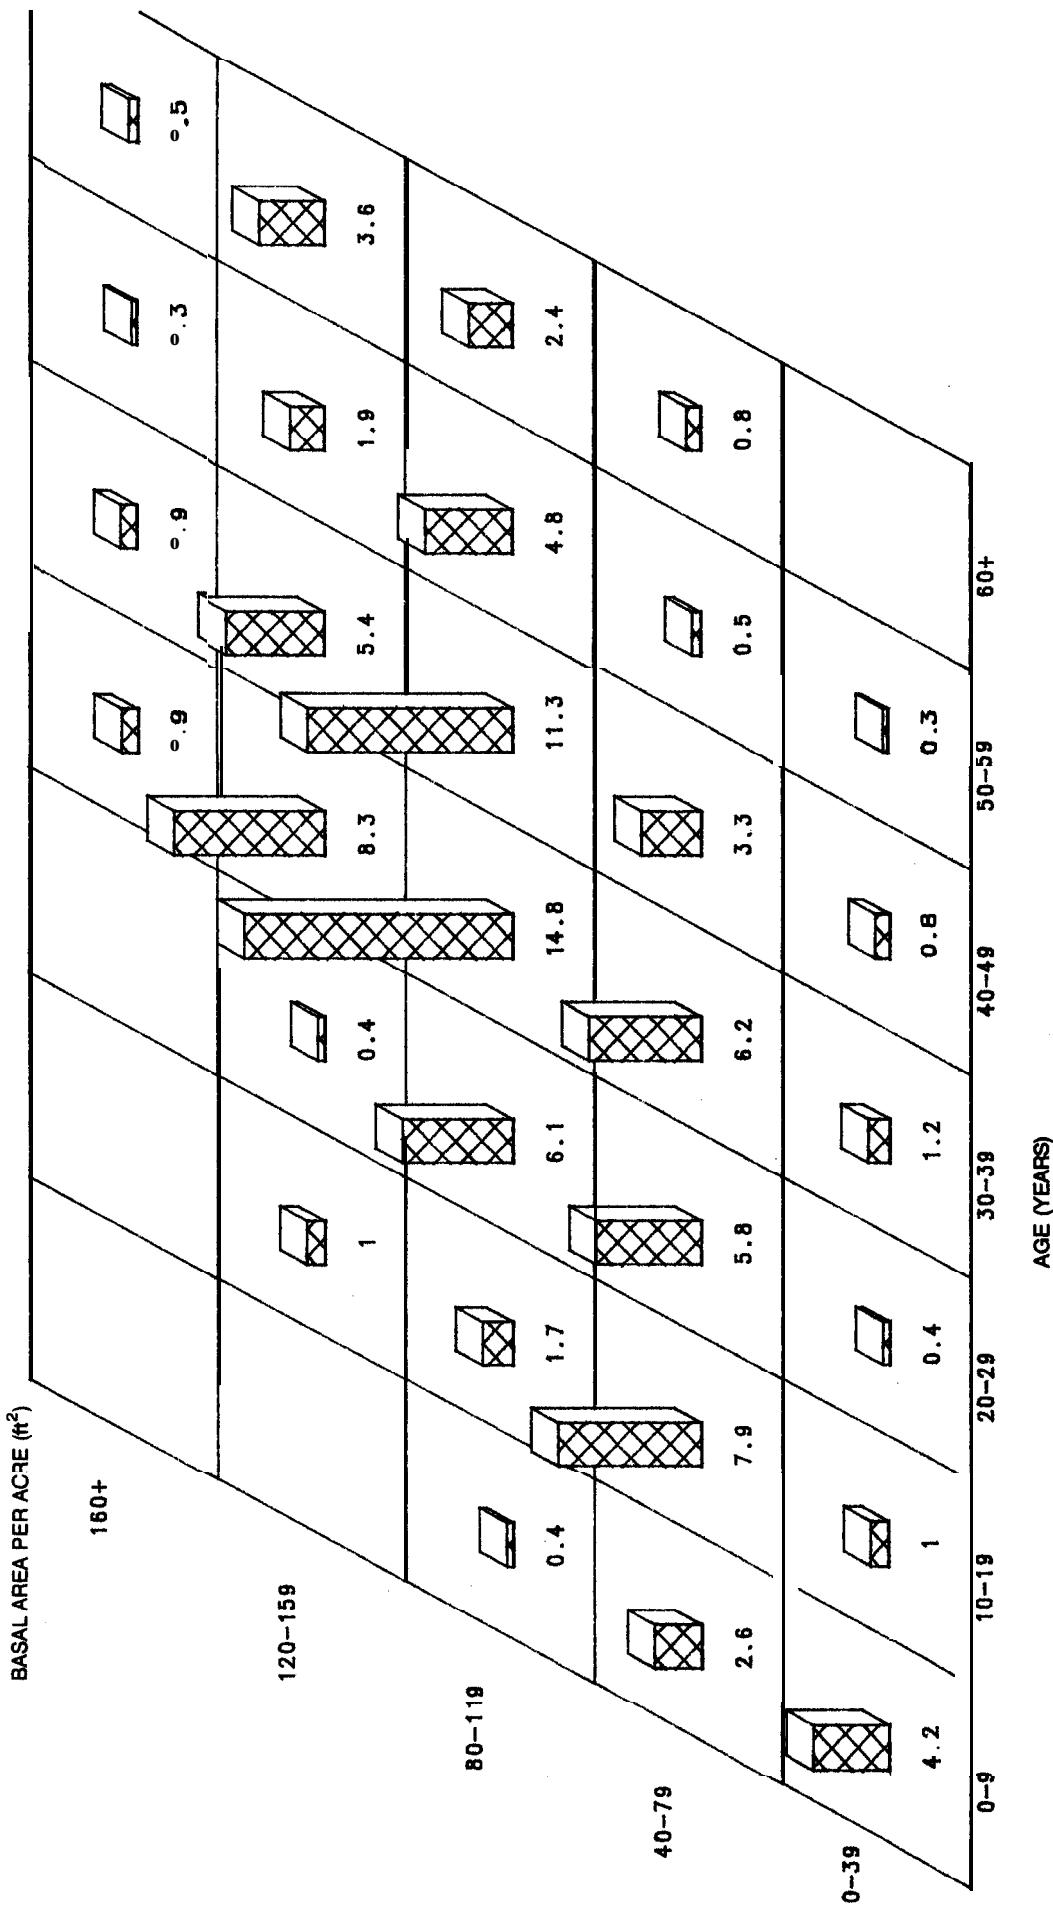

Figure 46.—Percentage distribution of shortleaf pine stands in Georgia, by basal area per acre and stand age. (Represents 909,258 acres of natural stands, and 5,446 acres of planted stands.)

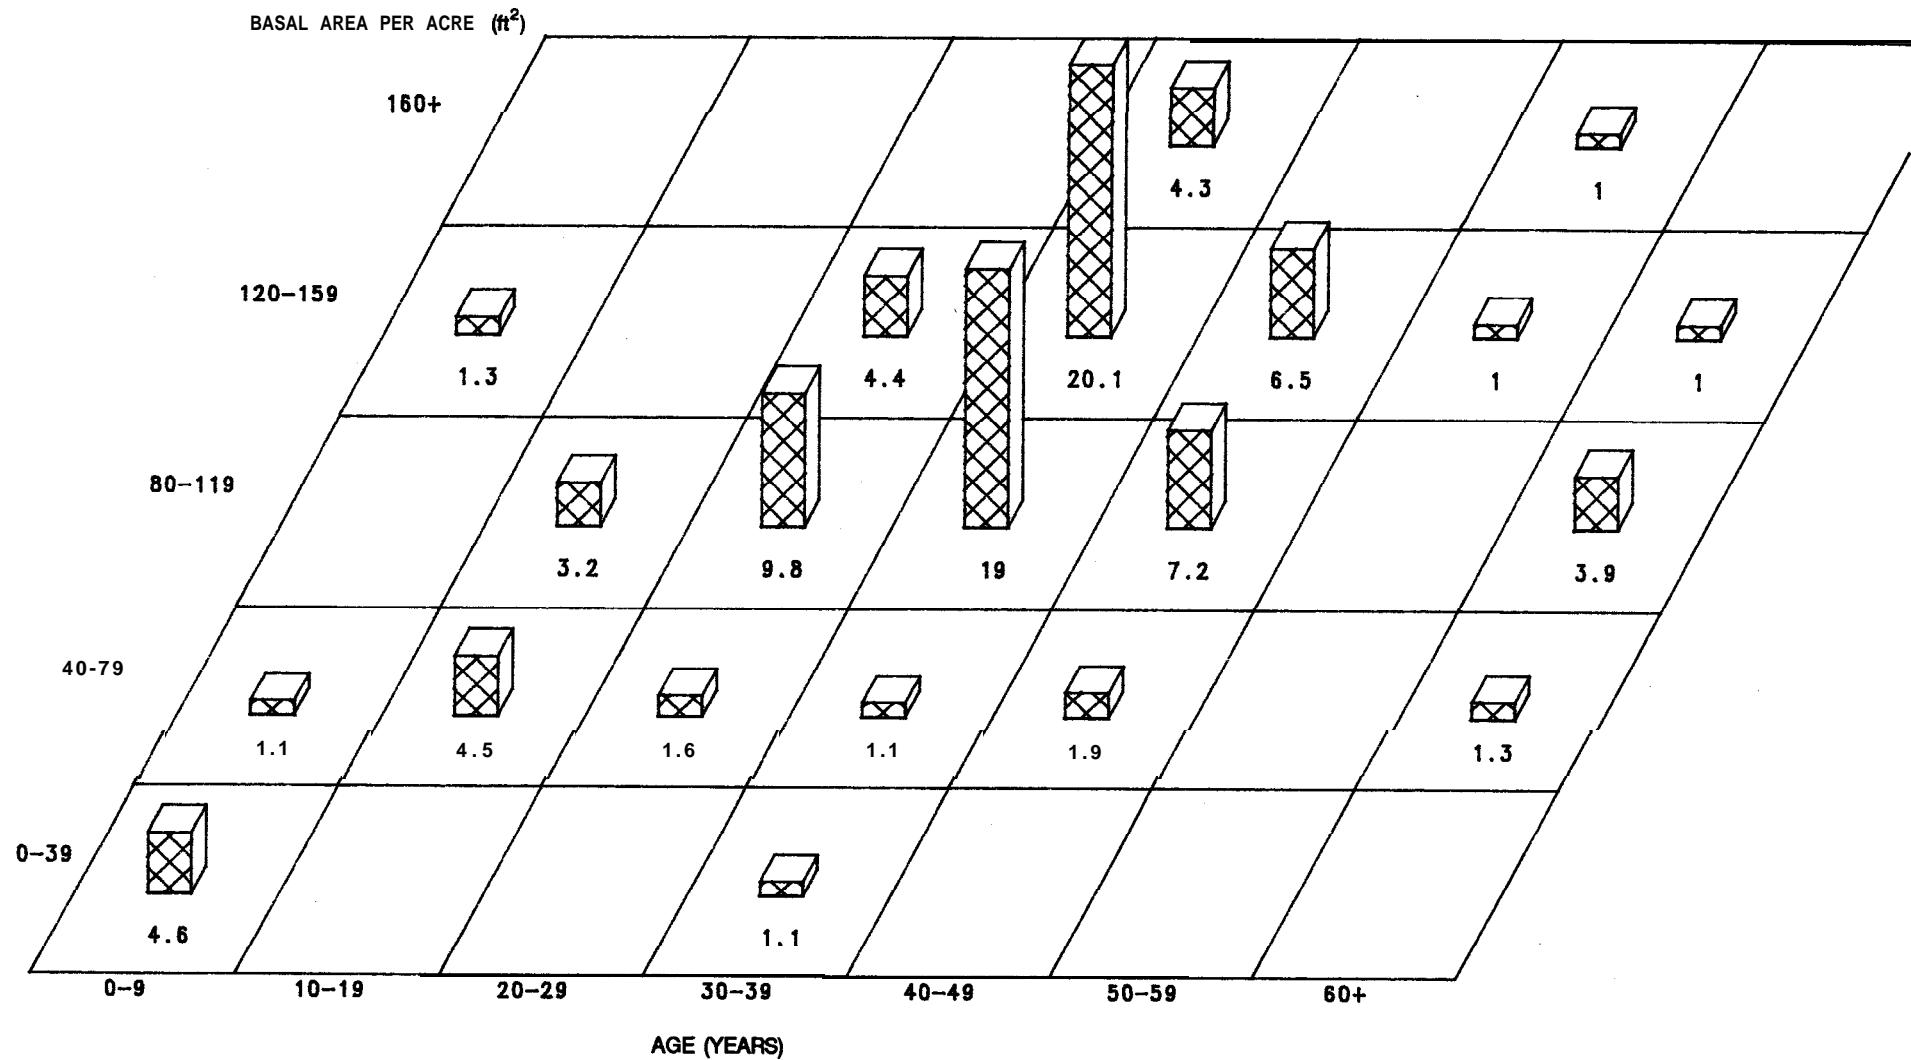

Figure 47.-Percentage distribution of Virginia pine stands in Georgia, by basal area per acre and stand age. (Represents 367,497 acres of natural stands, and 13,456 acres of planted stands.)

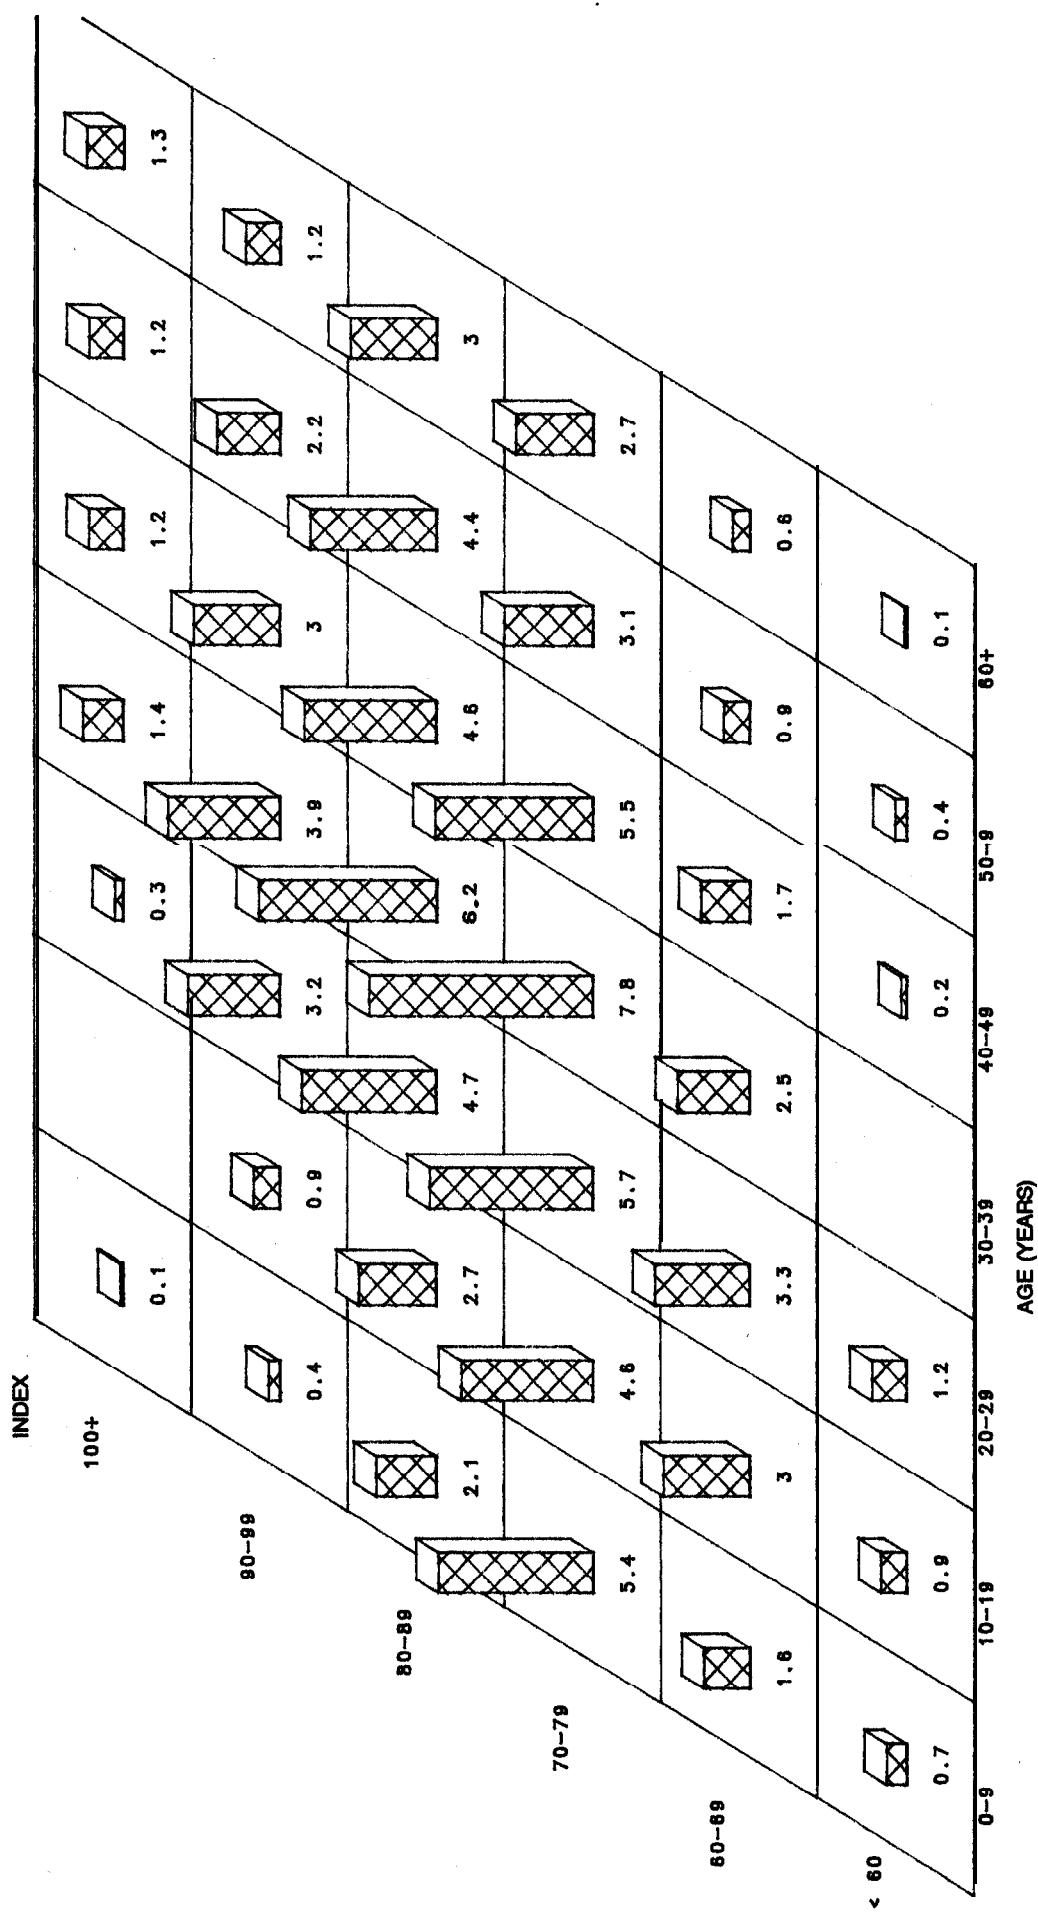

Figure 48A.—Percentage distribution of natural loblolly pine stands in North Carolina, by site index and stand age. (Represents 2,075,586 acres.)

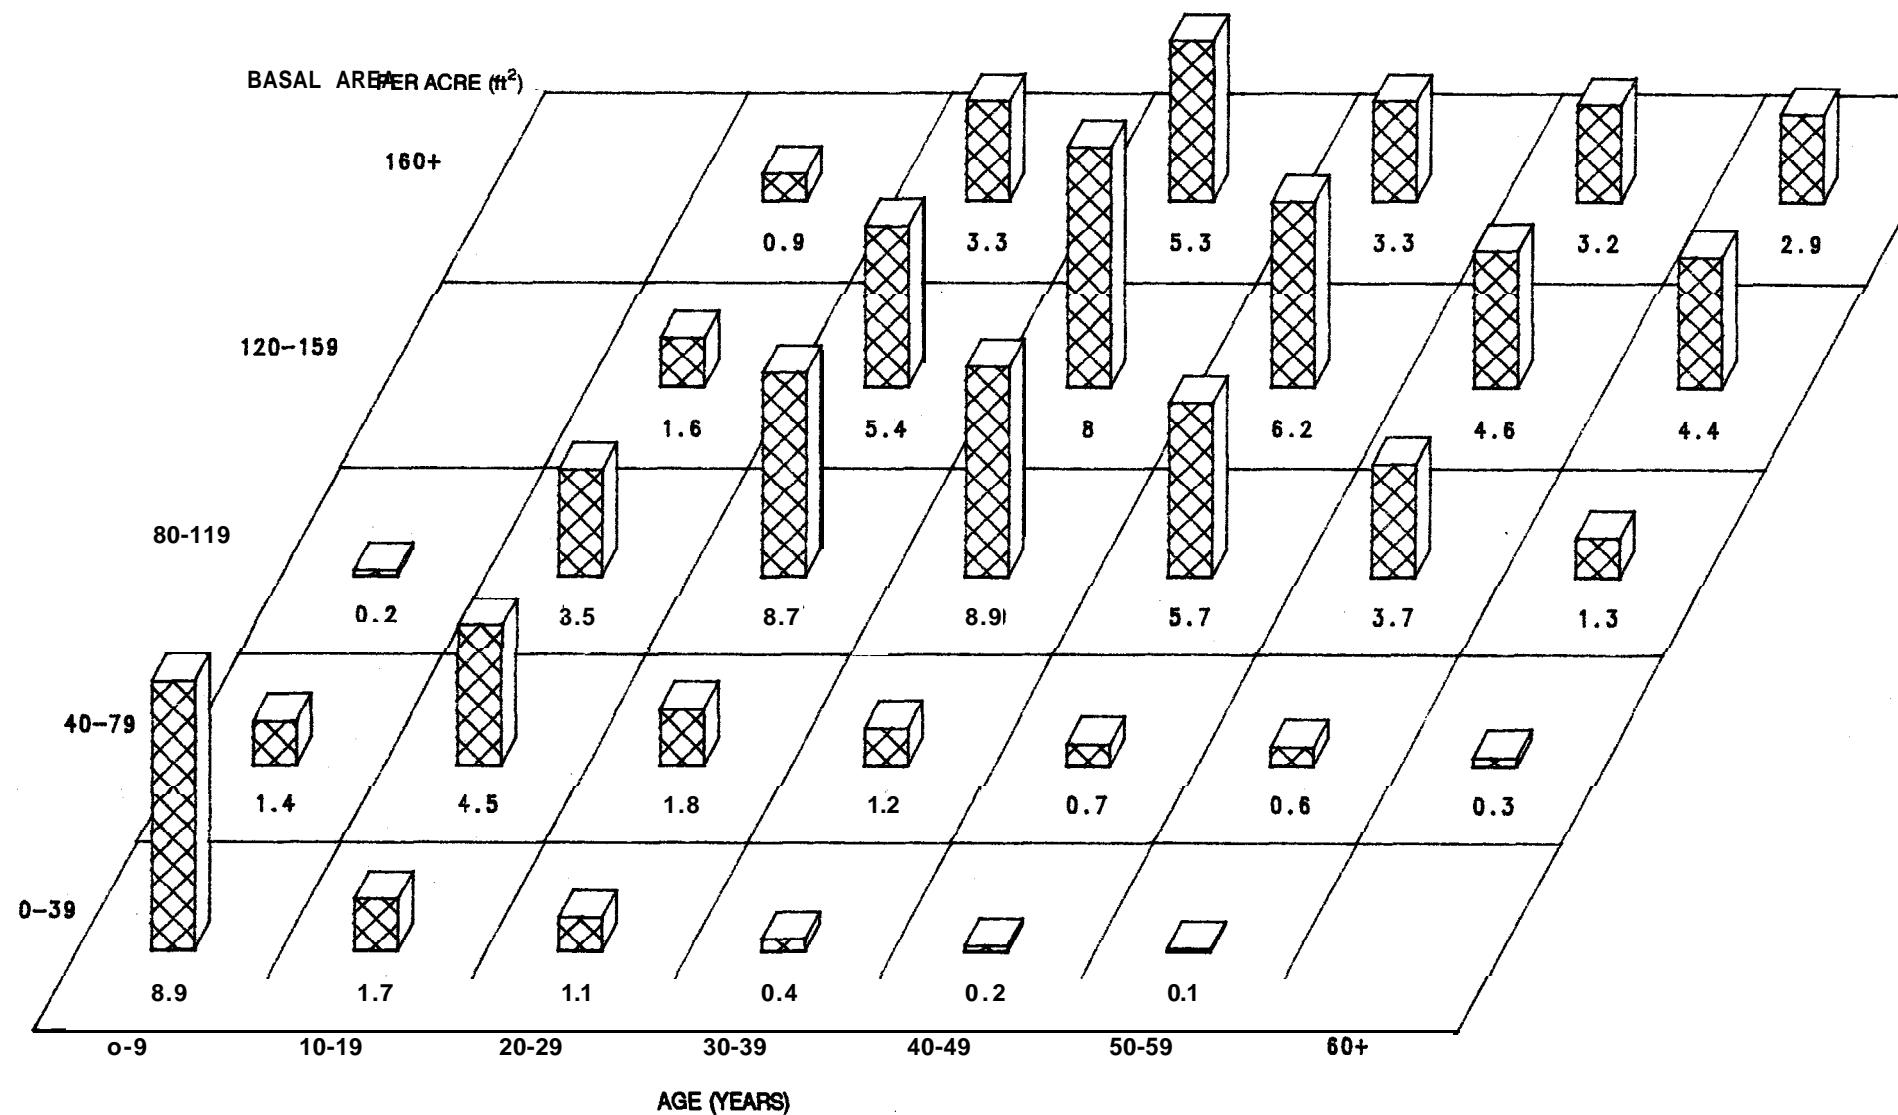

Figure 48B.--Percentage distribution of natural loblolly pine stands in North Carolina, by basal area per acre and stand age. (Represents 2,075,586 acres.)

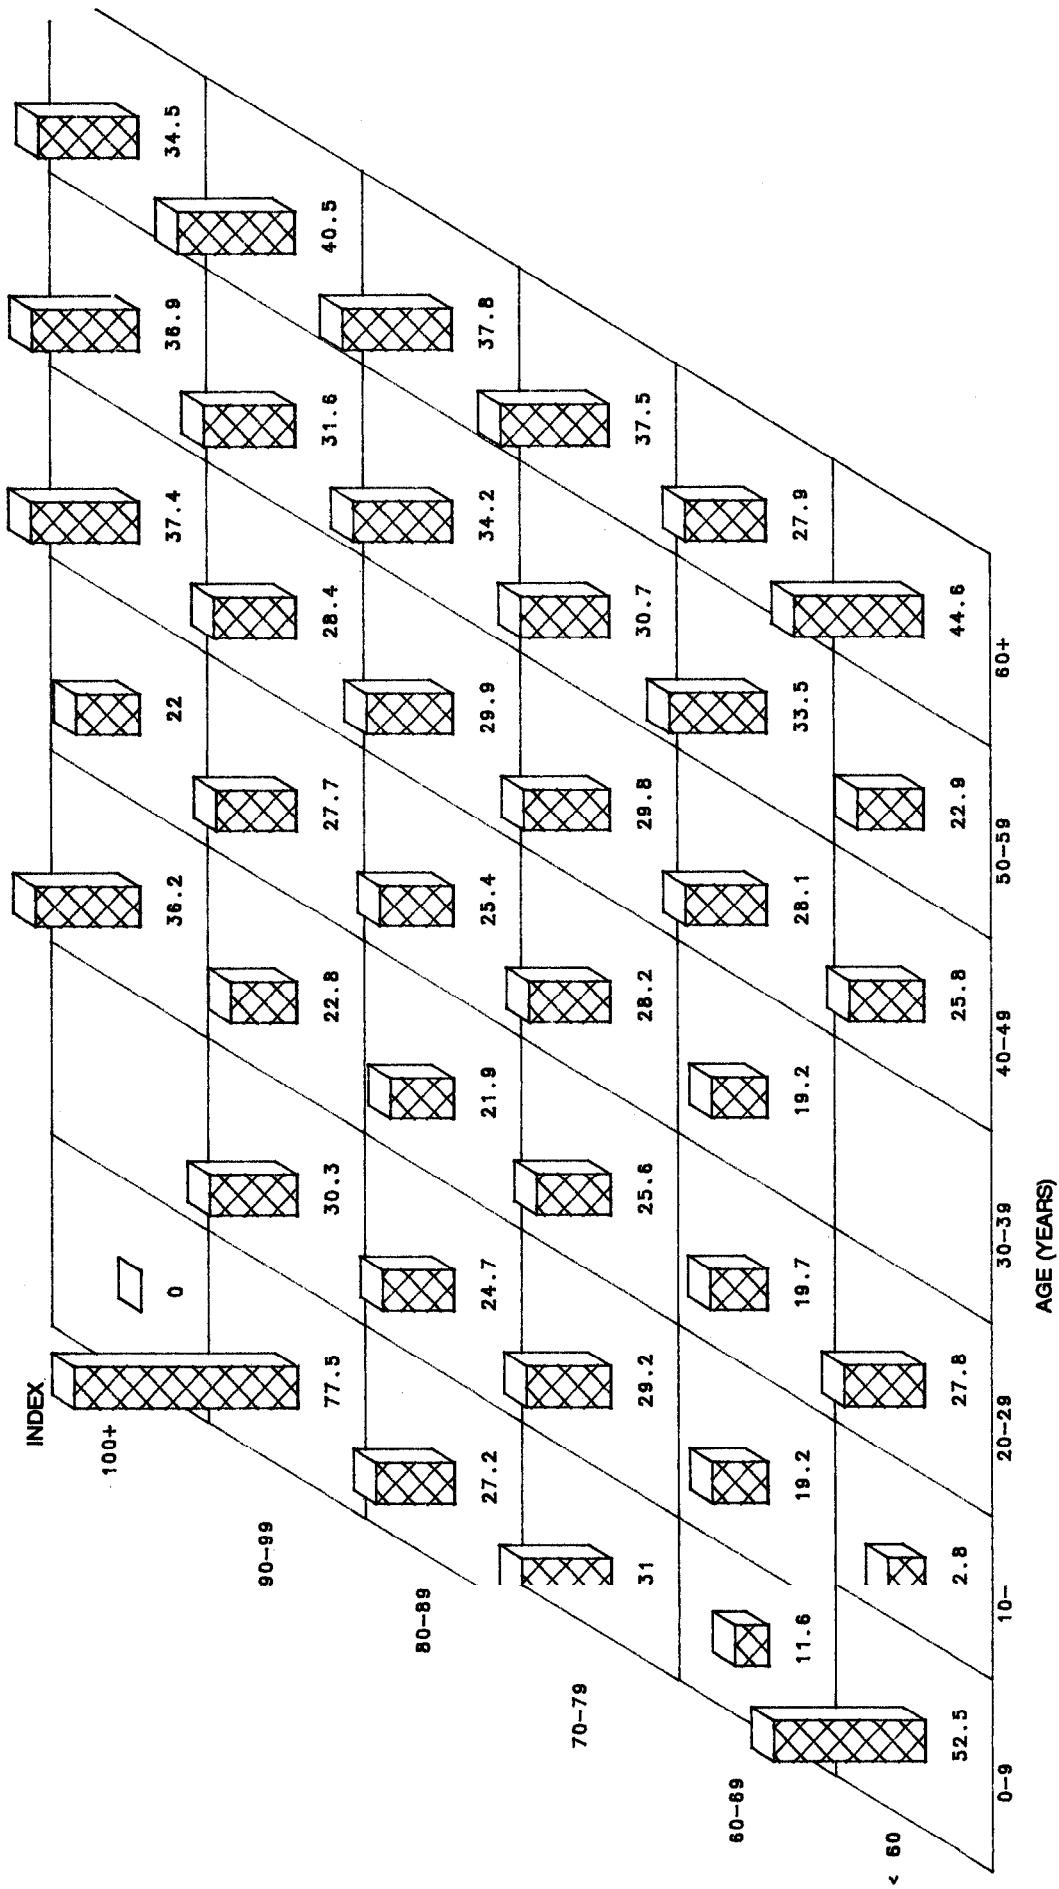

Figure 48C.—Percentage of basal area per acre in non-yellow pine species, by site index and stand age, for natural loblolly pine stands in North Carolina. (Representing 0.75,586 acres.)

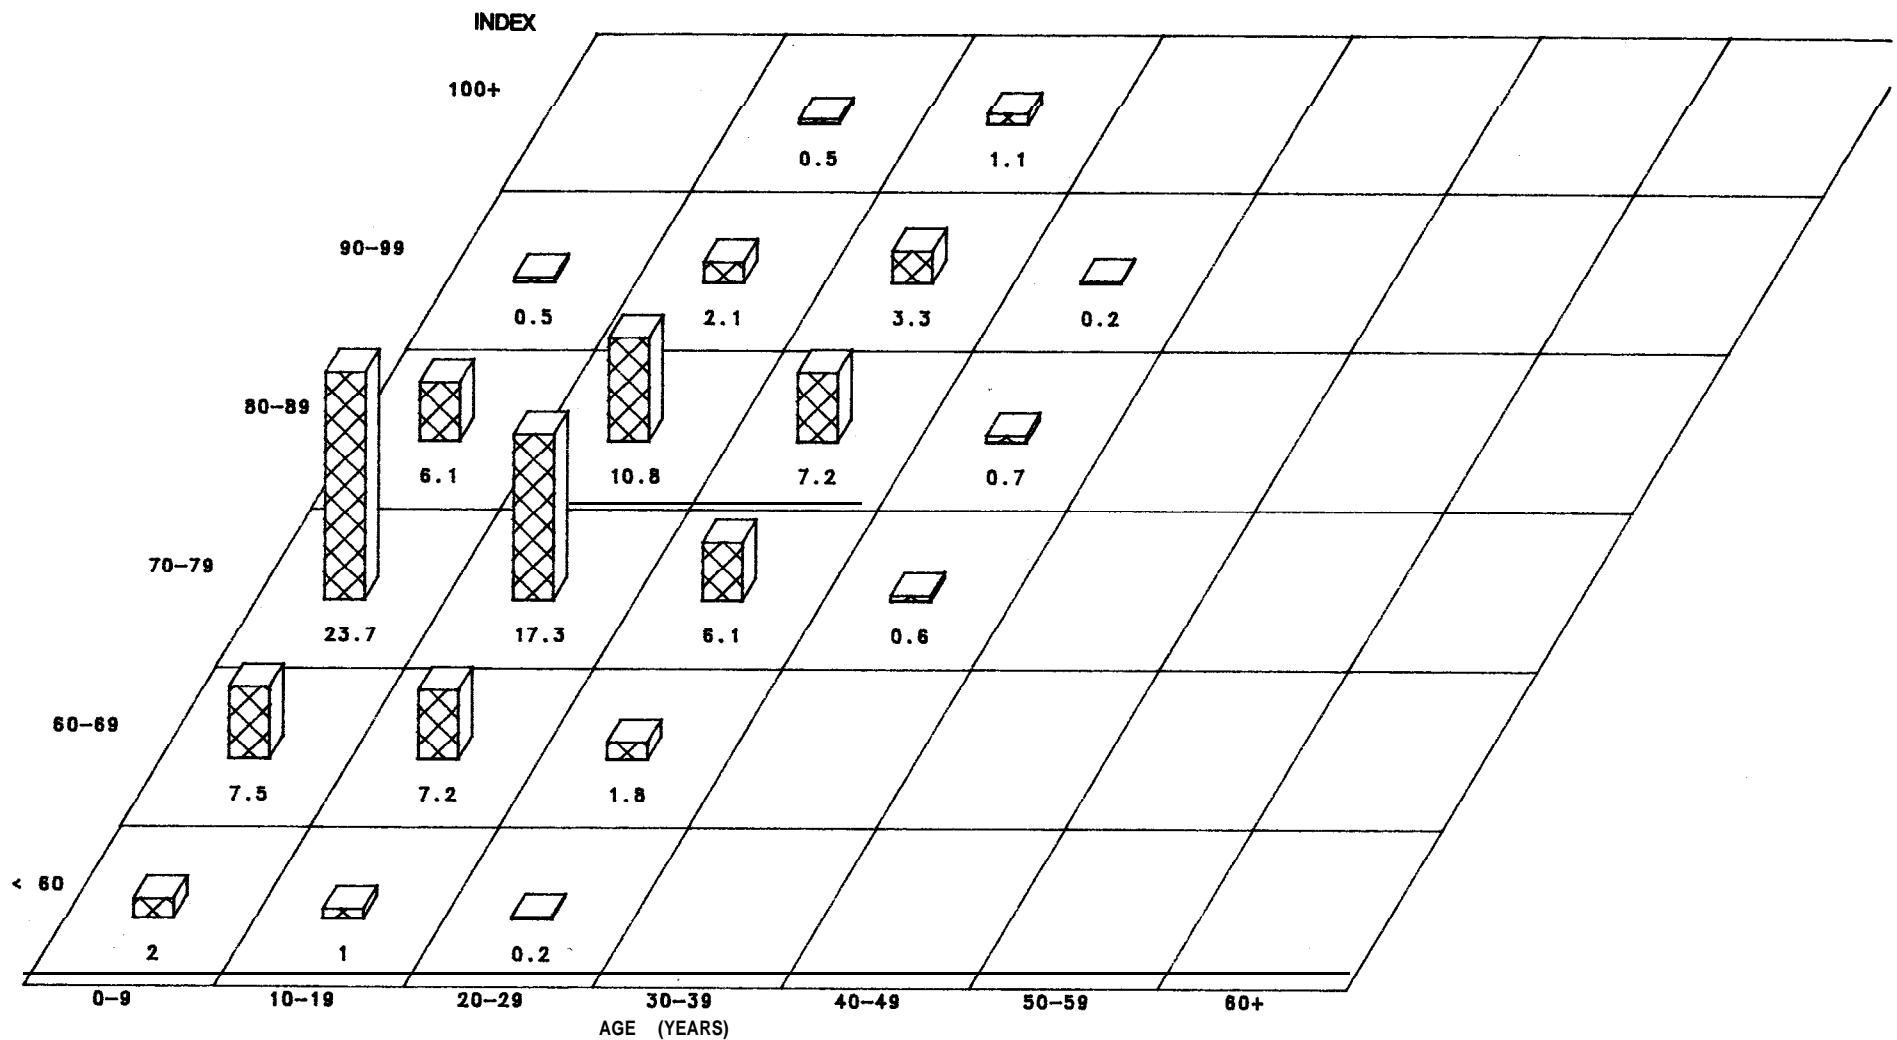

Figure 49A.—Percentage distribution of planted loblolly pine stands in North Carolina, by site index and stand age. (Represents 1333,621 acres.)

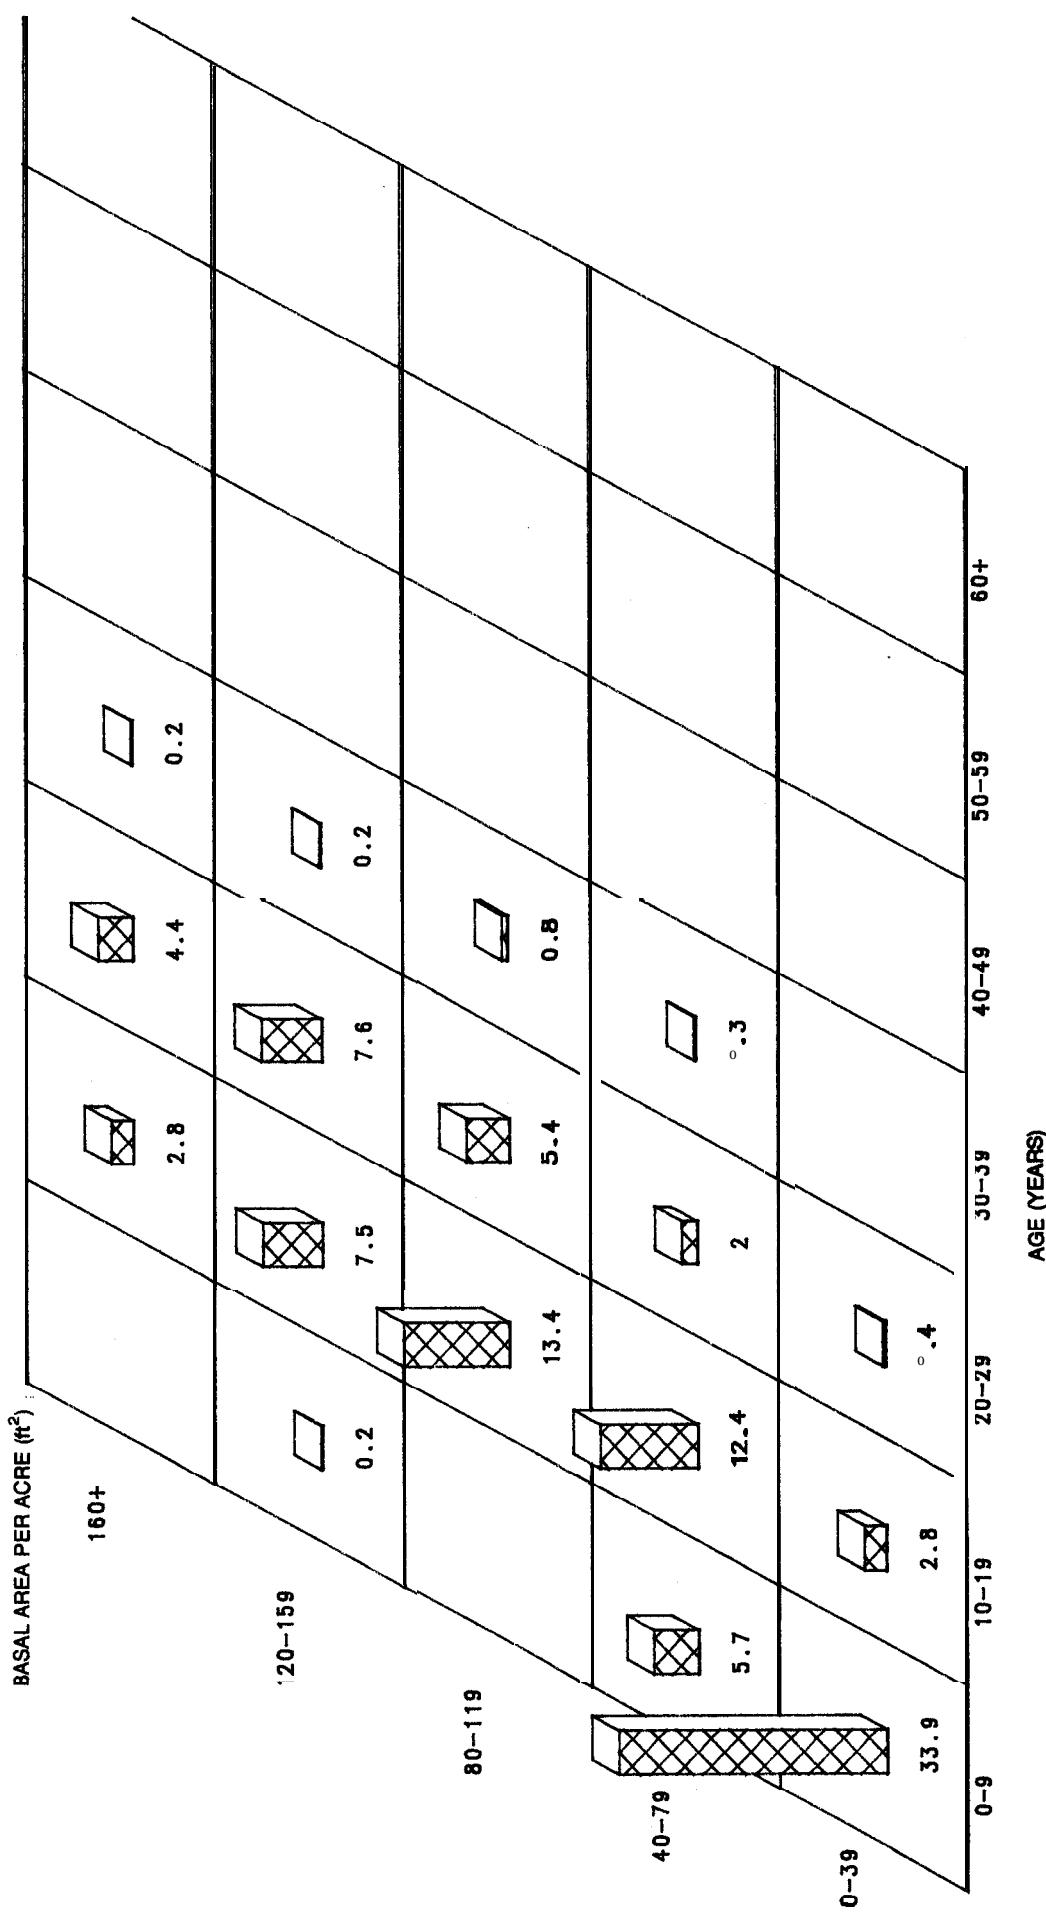

Figure 49B.—Percentage distribution of planted loblolly pine stands in North Carolina, by basal area per acre and stand age. (Represents 1,331,621 acres.)

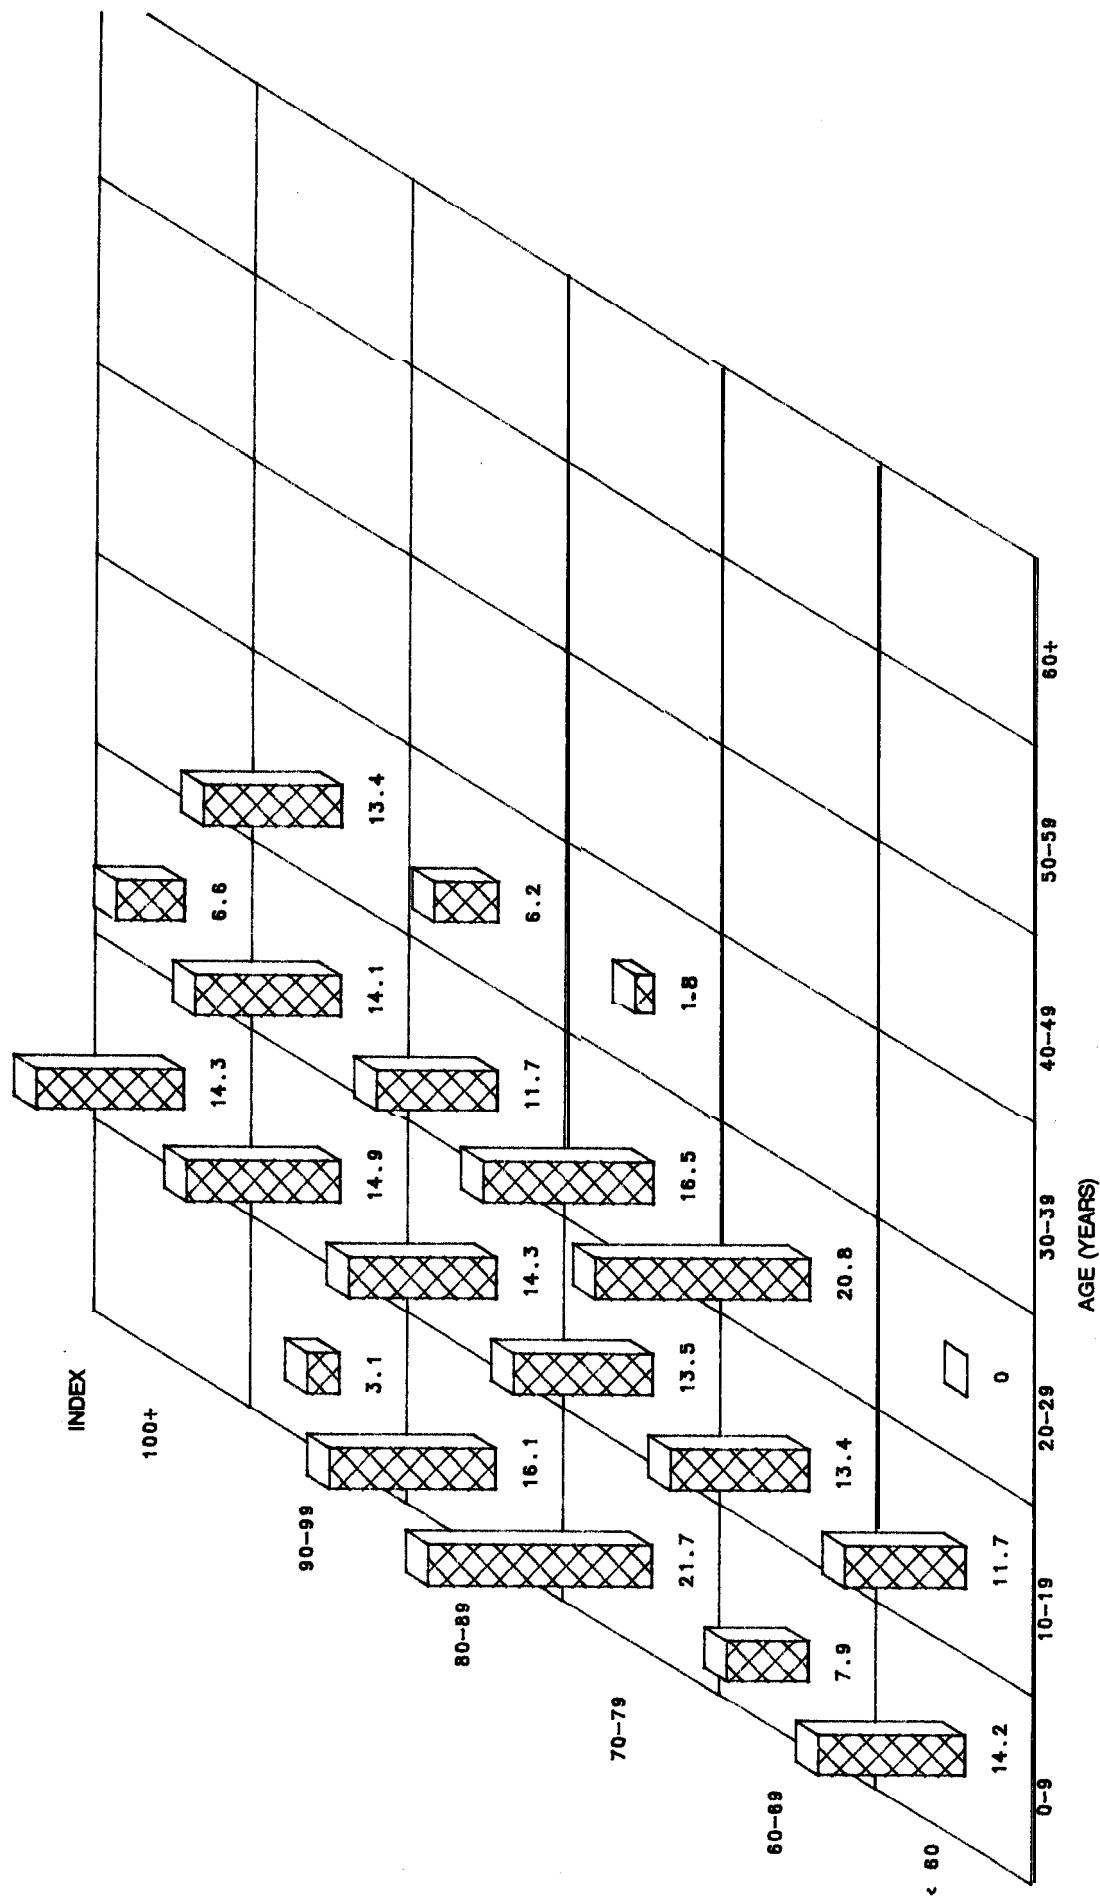

Figure 49C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for planted loblolly pine stands in North Carolina. (Represents 1,331,621 acres.)

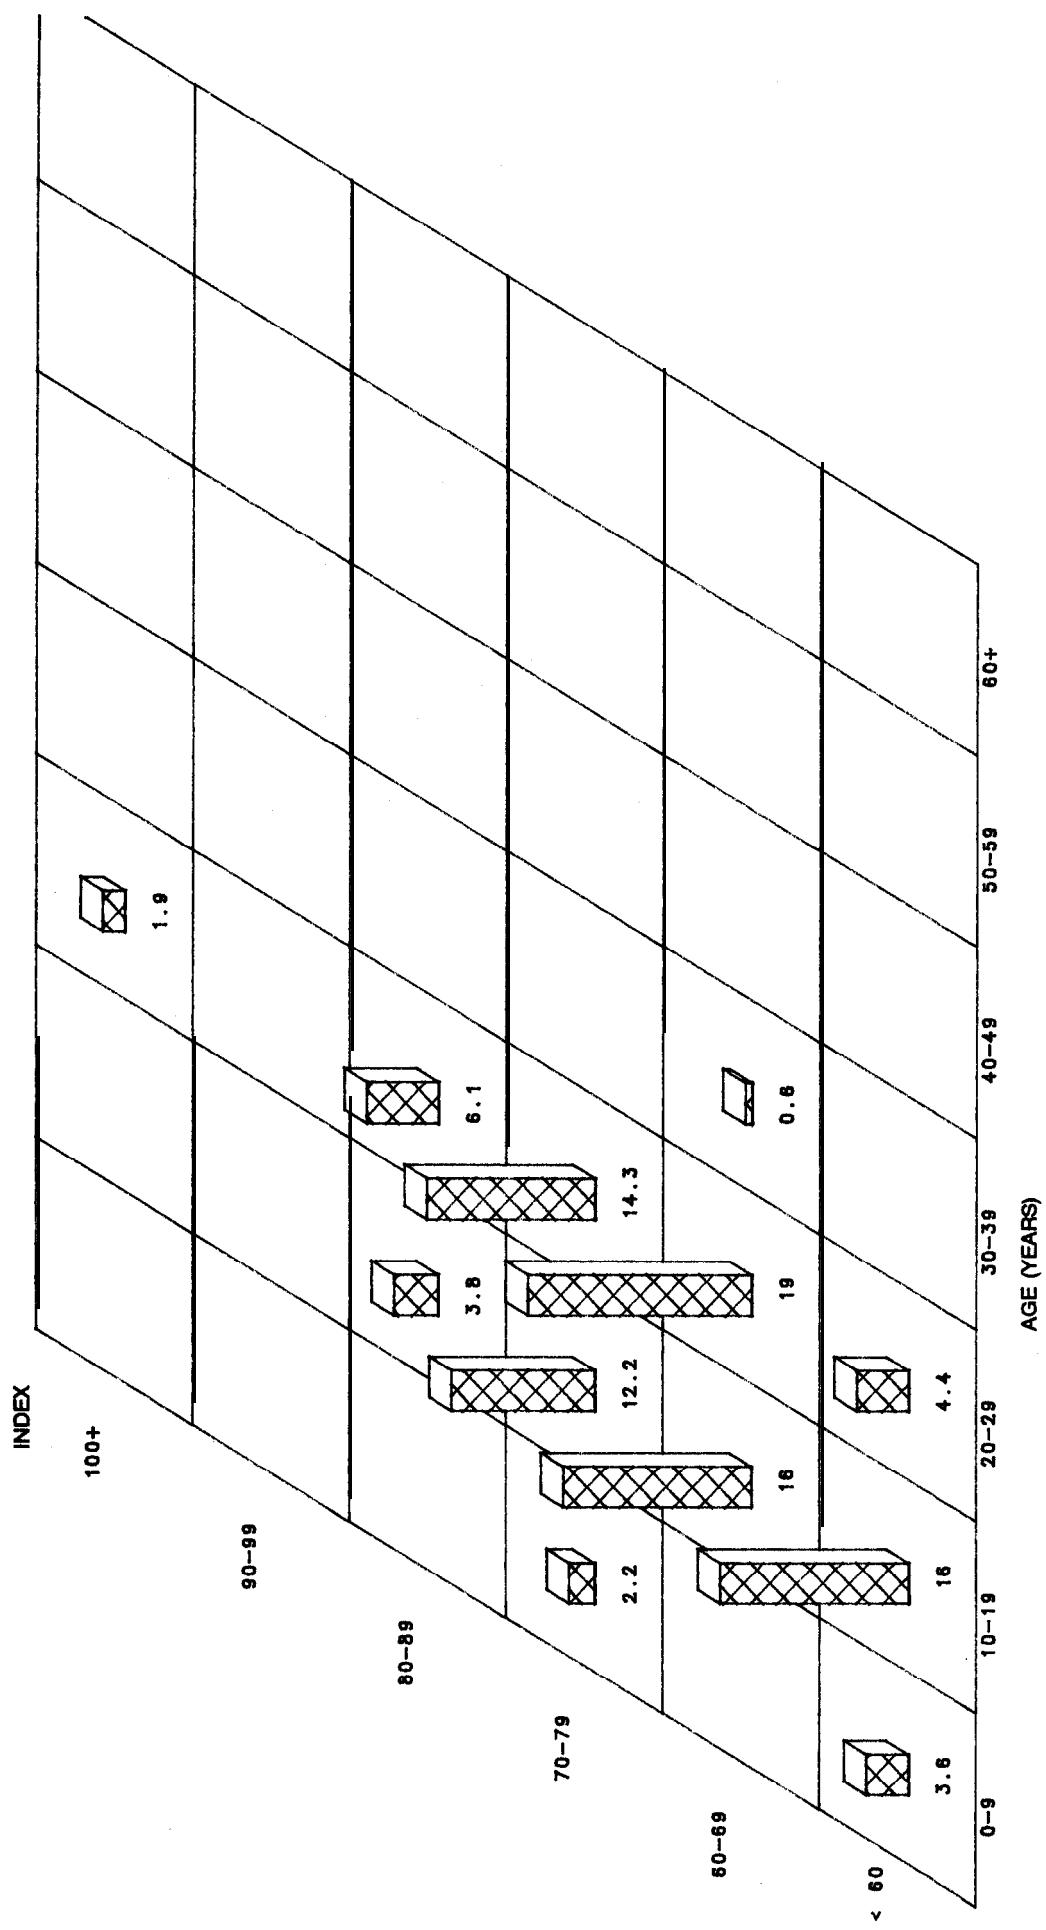

Figure 50A.—Percentage distribution of planted slash pine stands in North Carolina, by site index and stand age. (Represents 195,365 acres.)

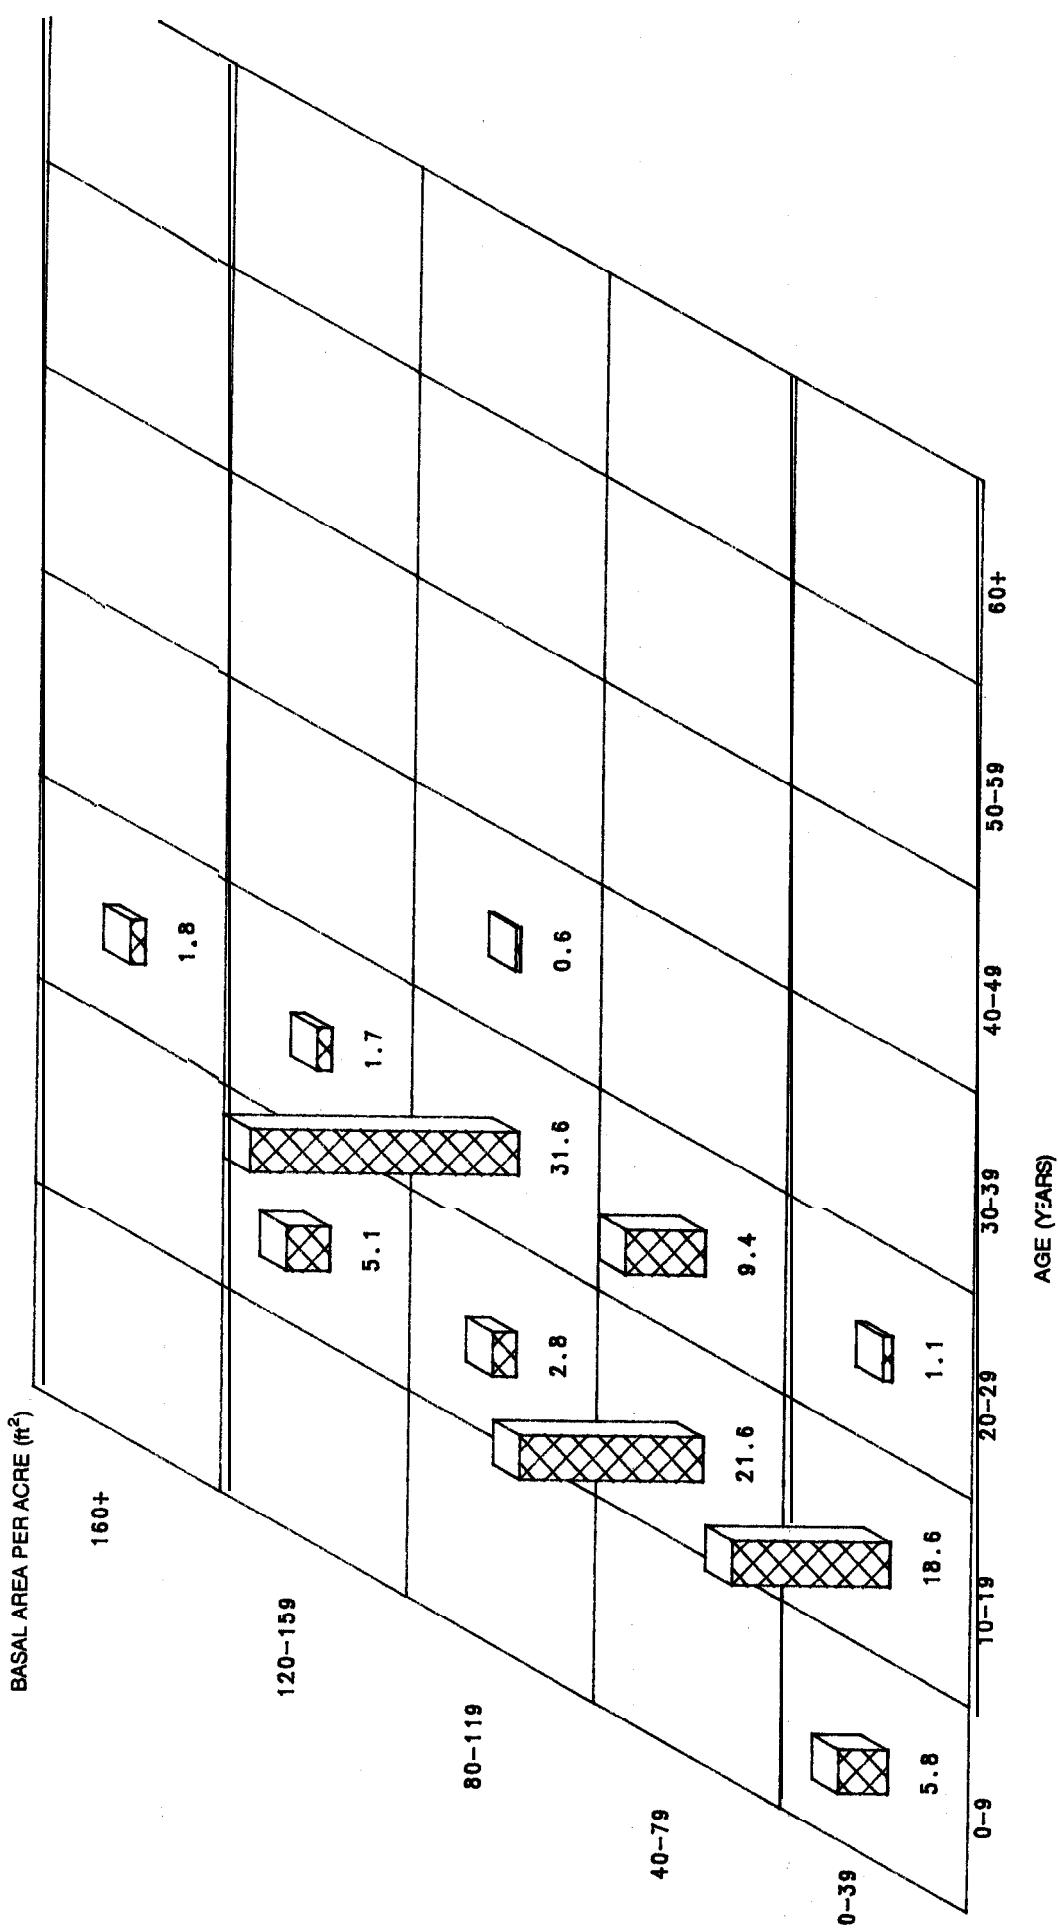

Figure 50B.—Percentage distribution of planted slash pine stands in North Carolina, by basal area per acre and stand age. (Represents 195,365 acres.)

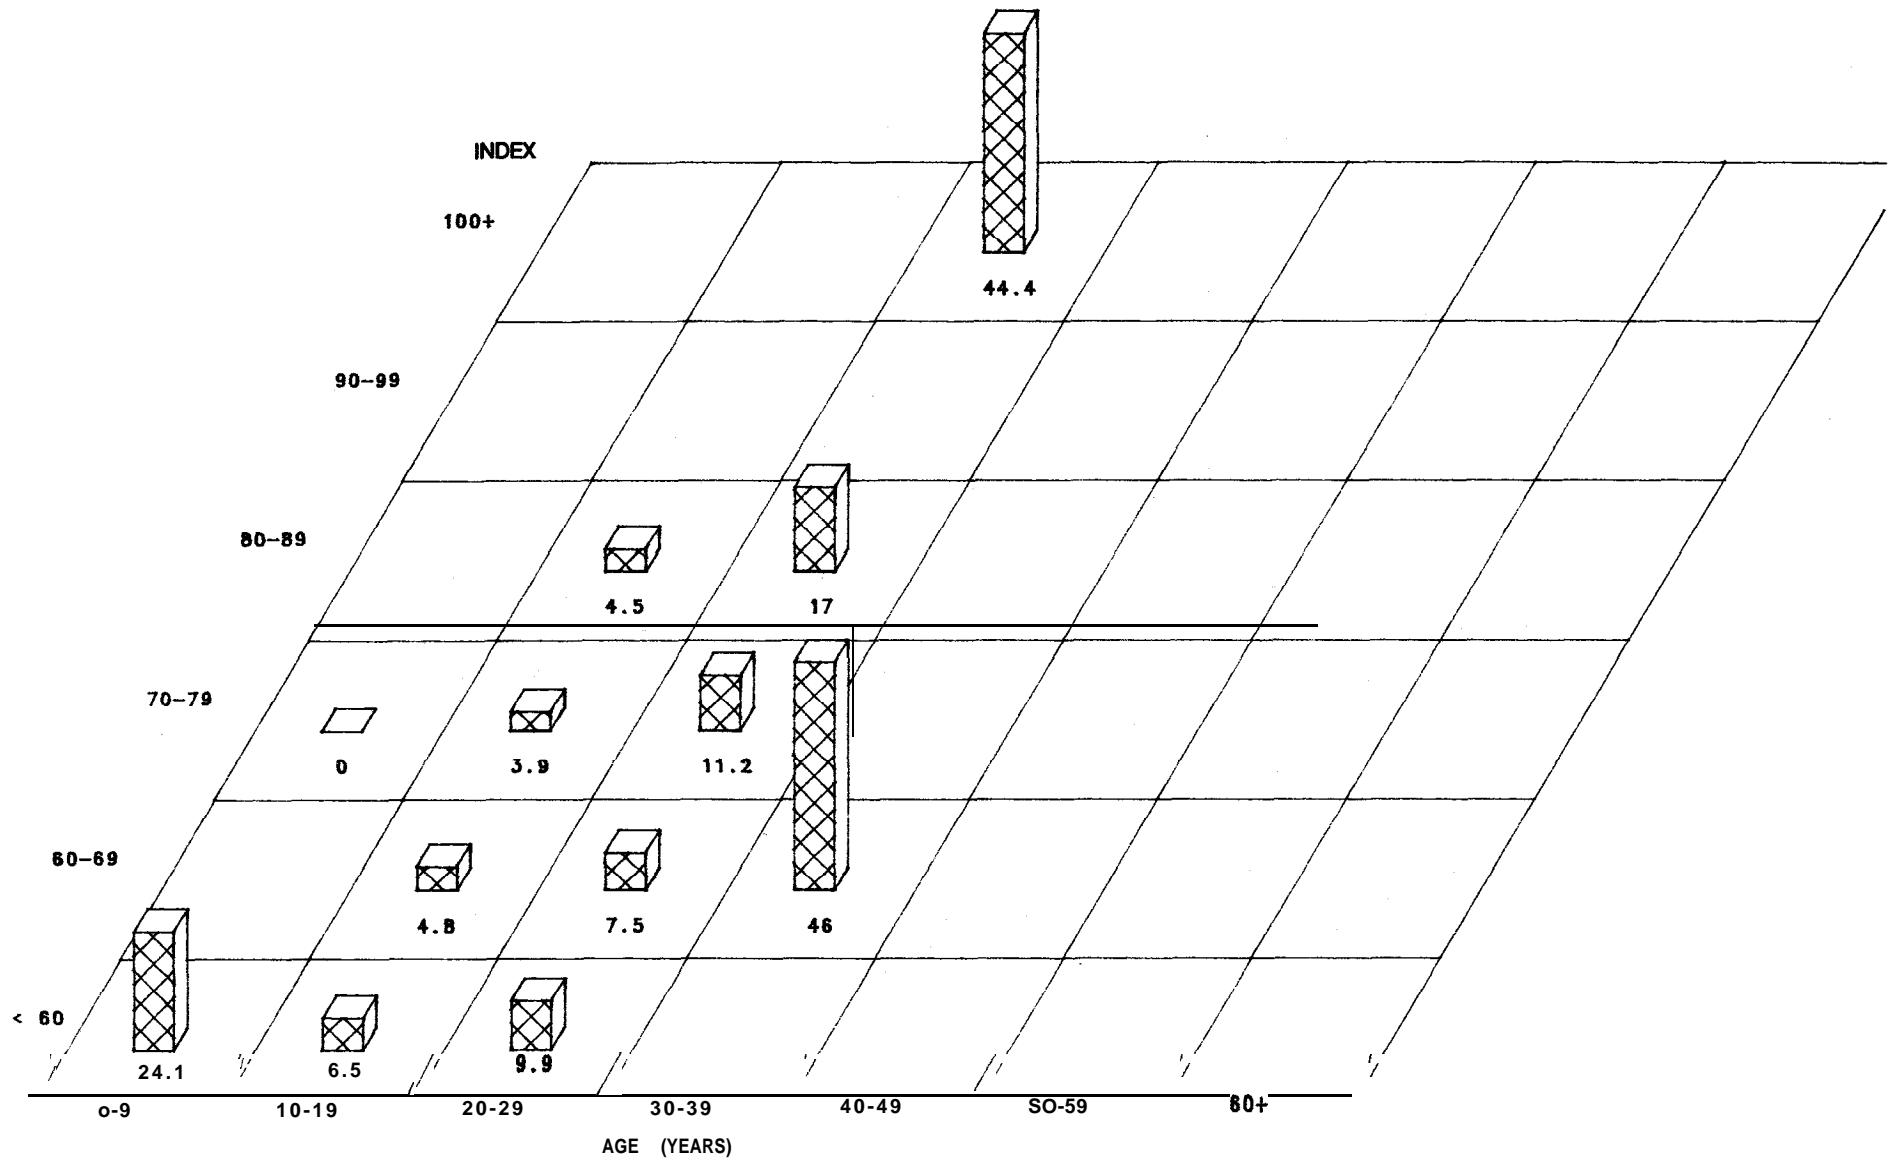

Figure 50C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for planted slash pine stands in North Carolina (Represents 195,365 acres.)

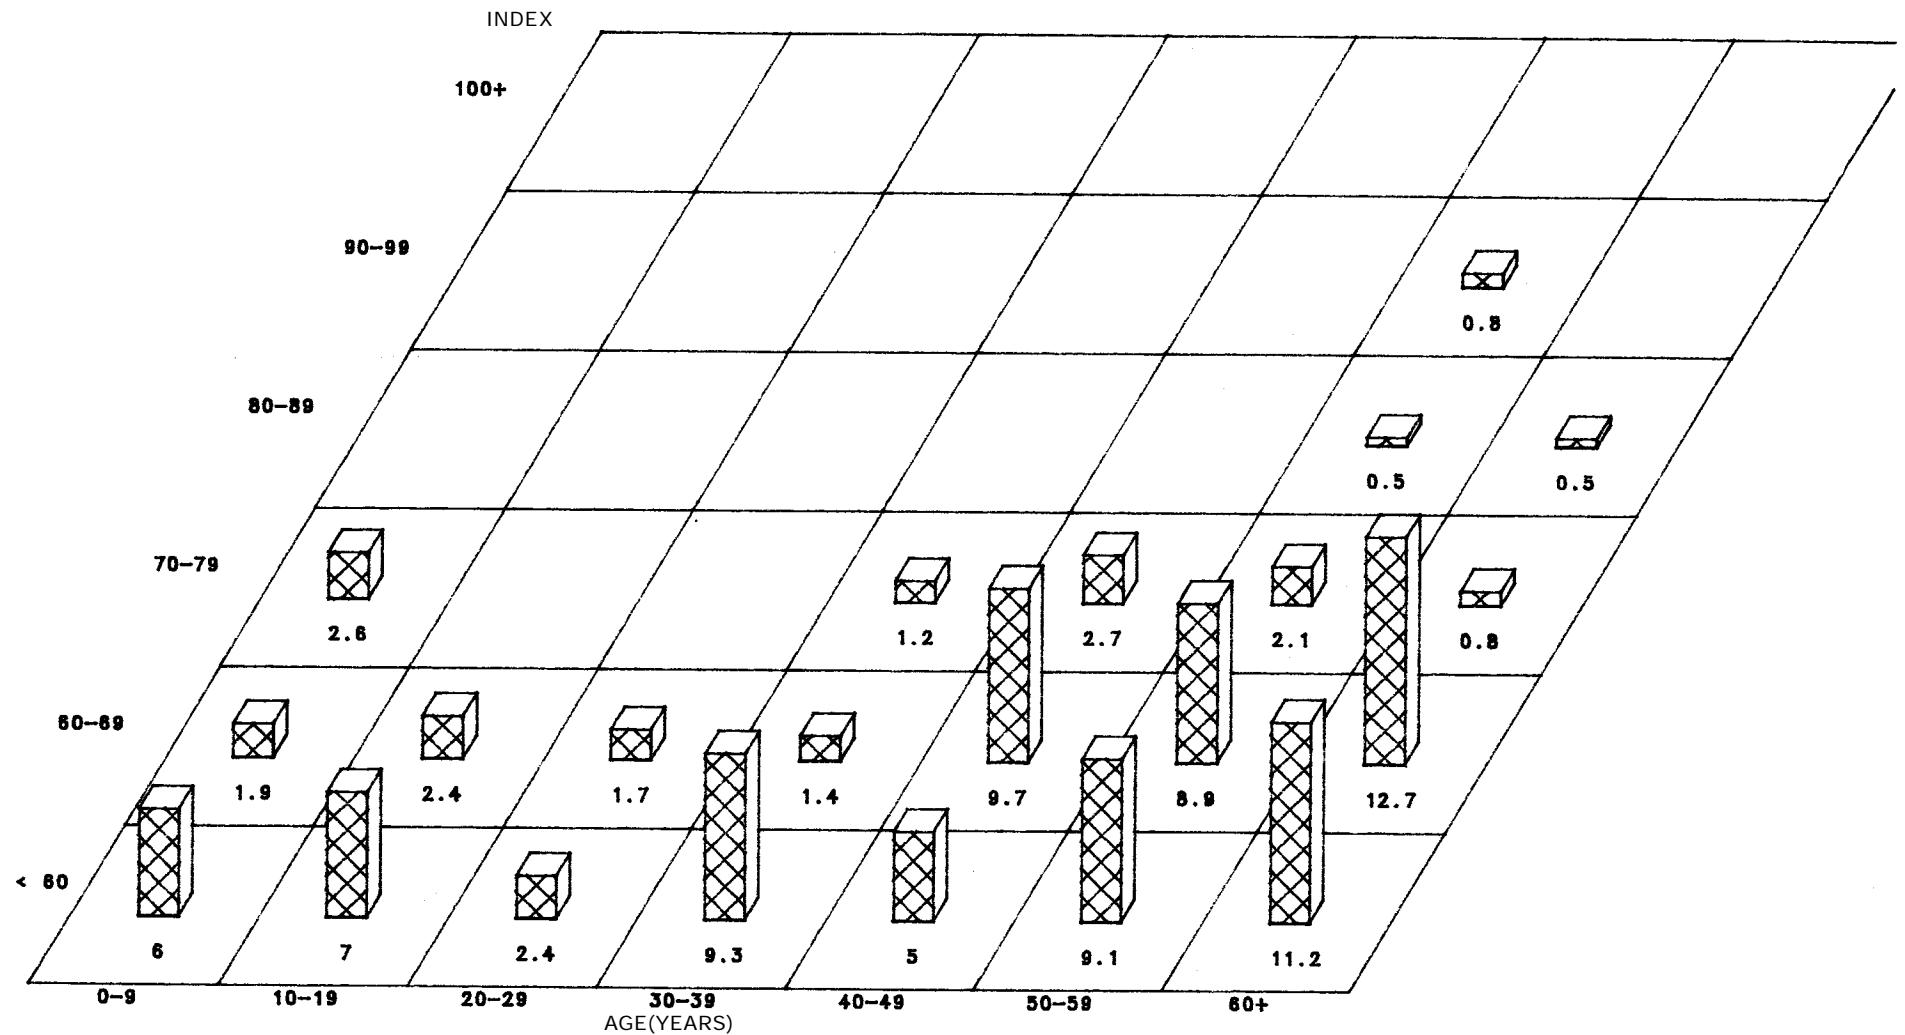

Figure 51A--Percentage distribution of longleaf pine stands in North Carolina, by site index and stand age. (Represents 357,395 acres of natural stands, and 31,618 ~~acres~~ of planted stands.)

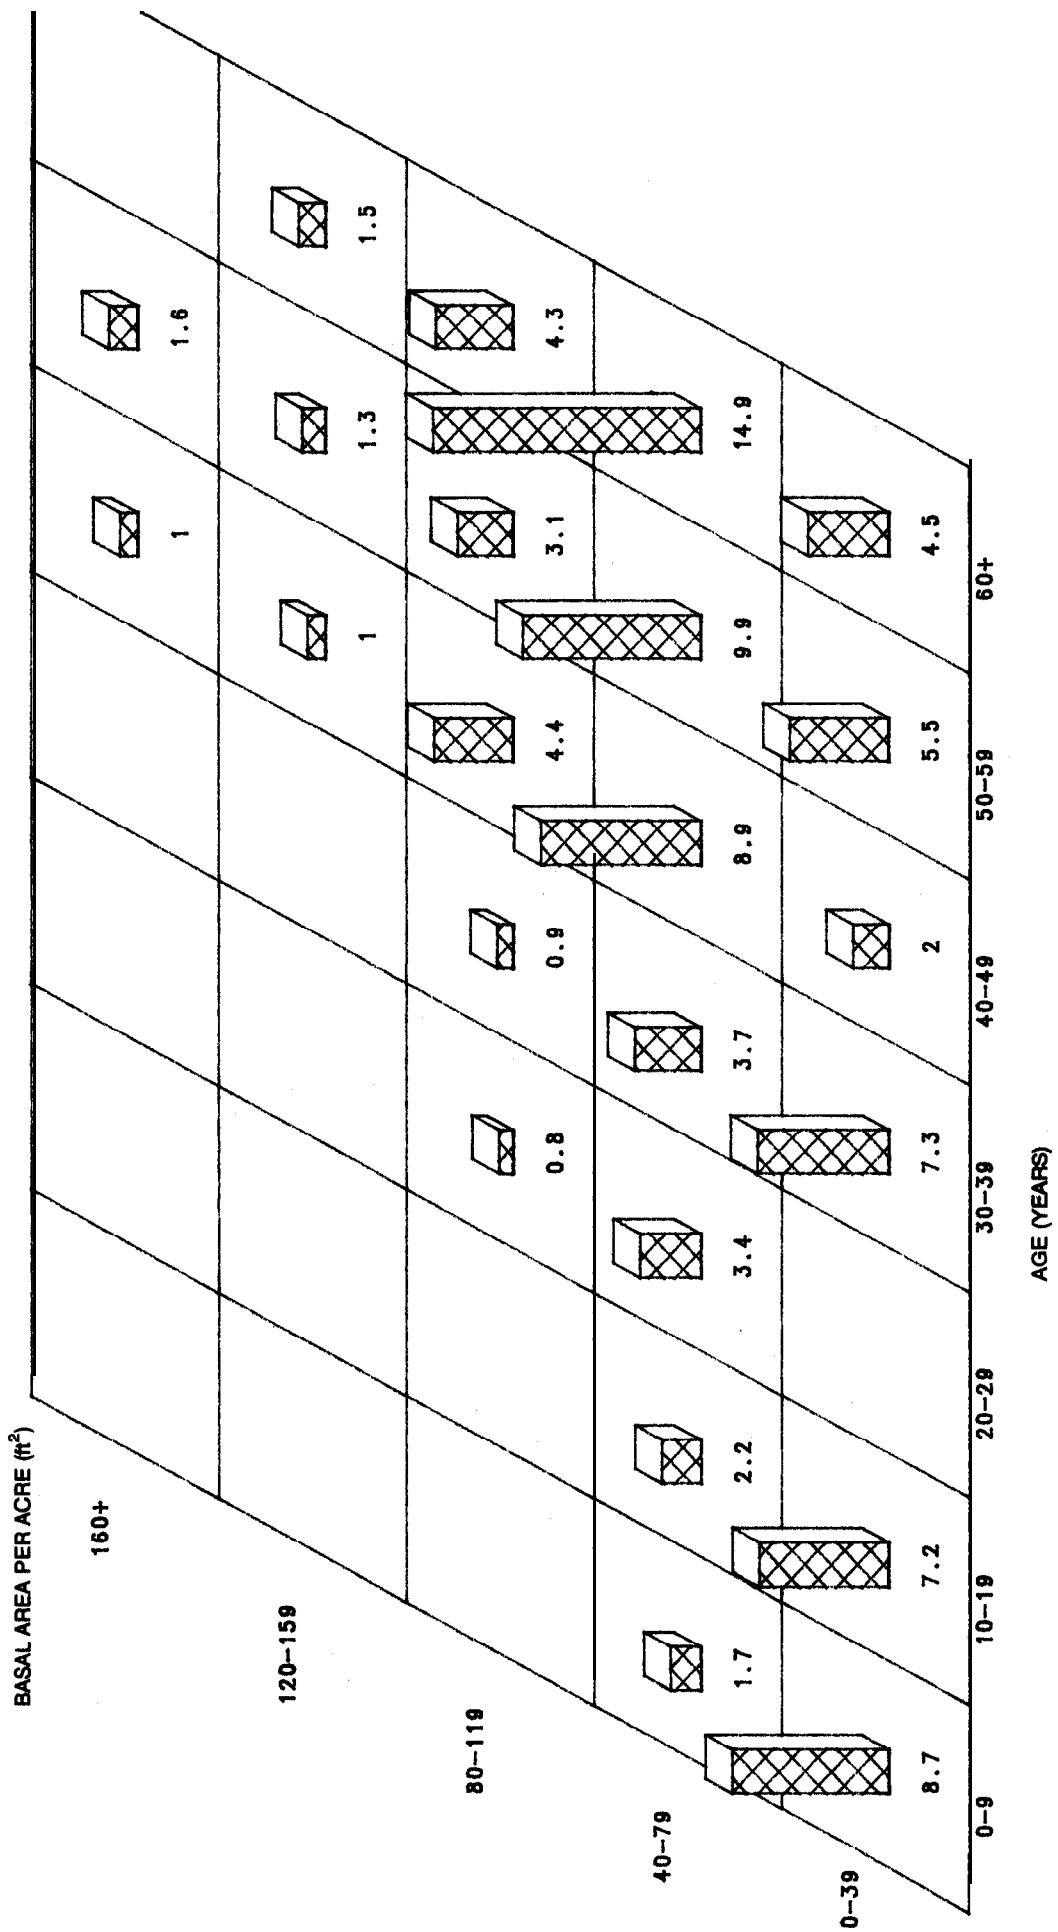

Figure 51B.—Percentage distribution of longleaf pine stands in North Carolina, by basal area per acre and stand age. (Represents 357,395 acres of natural stands, and 31,618 acres of planted stands.)

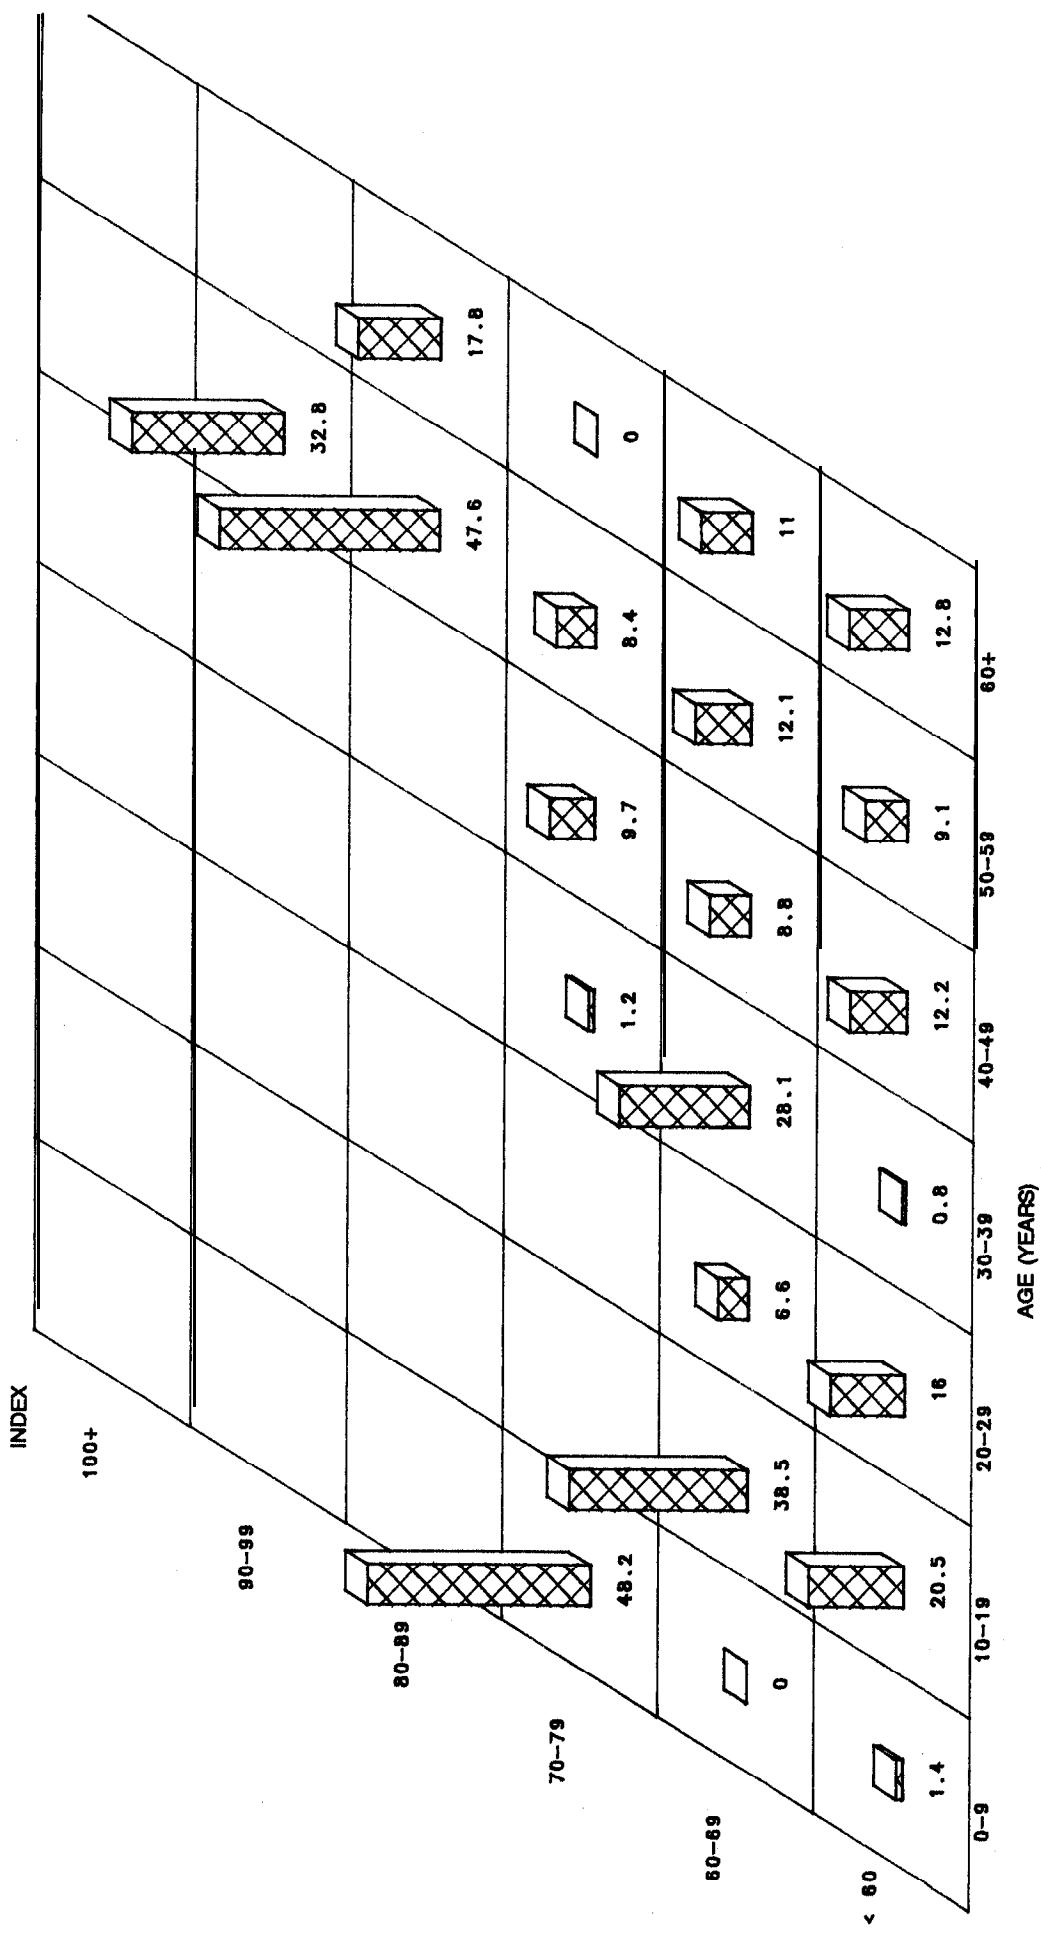

Figure 51C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for longleaf pine stands in North Carolina.
(Represents 357,395 acres of natural stands, and 31,618 acres of planted stands.)

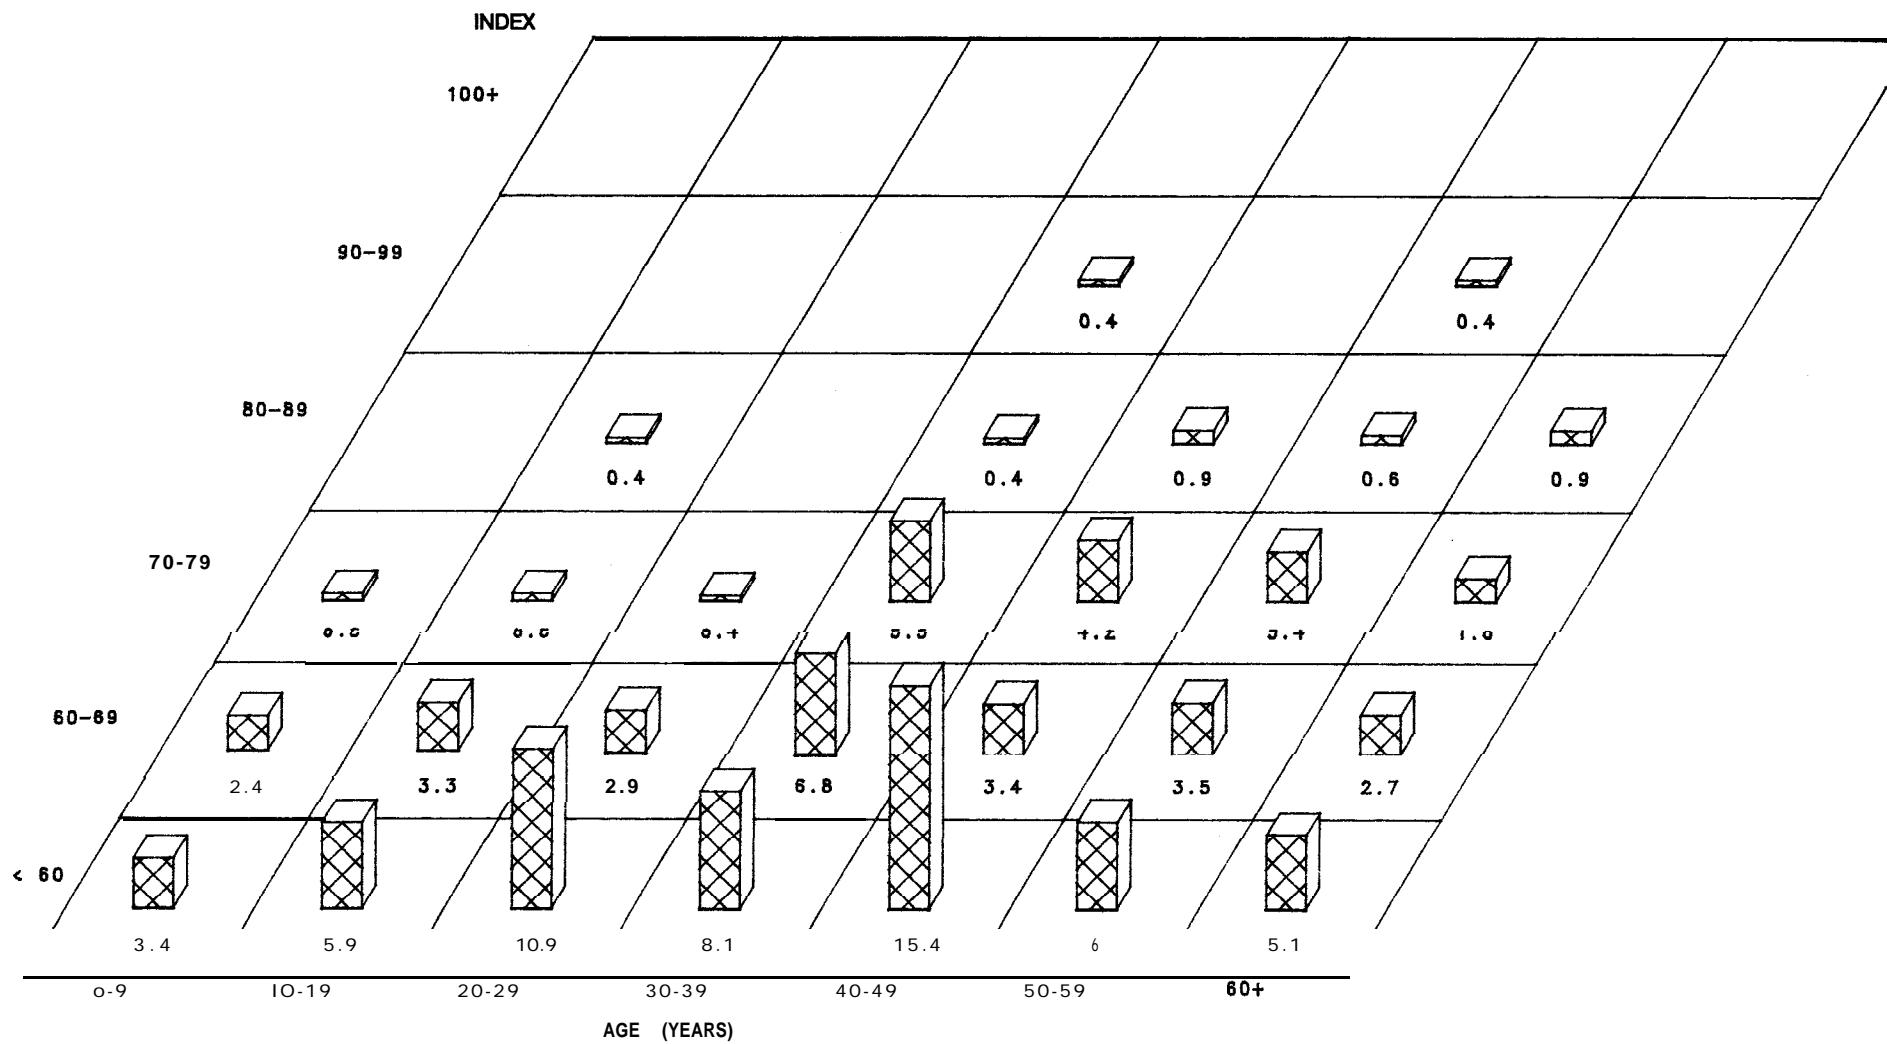

Figure 52A.—Percentage distribution of pond pine stands in North Carolina, by site index and stand age. (Represents 739,194 acres of natural stands, and 3,656 acres of planted stands.)

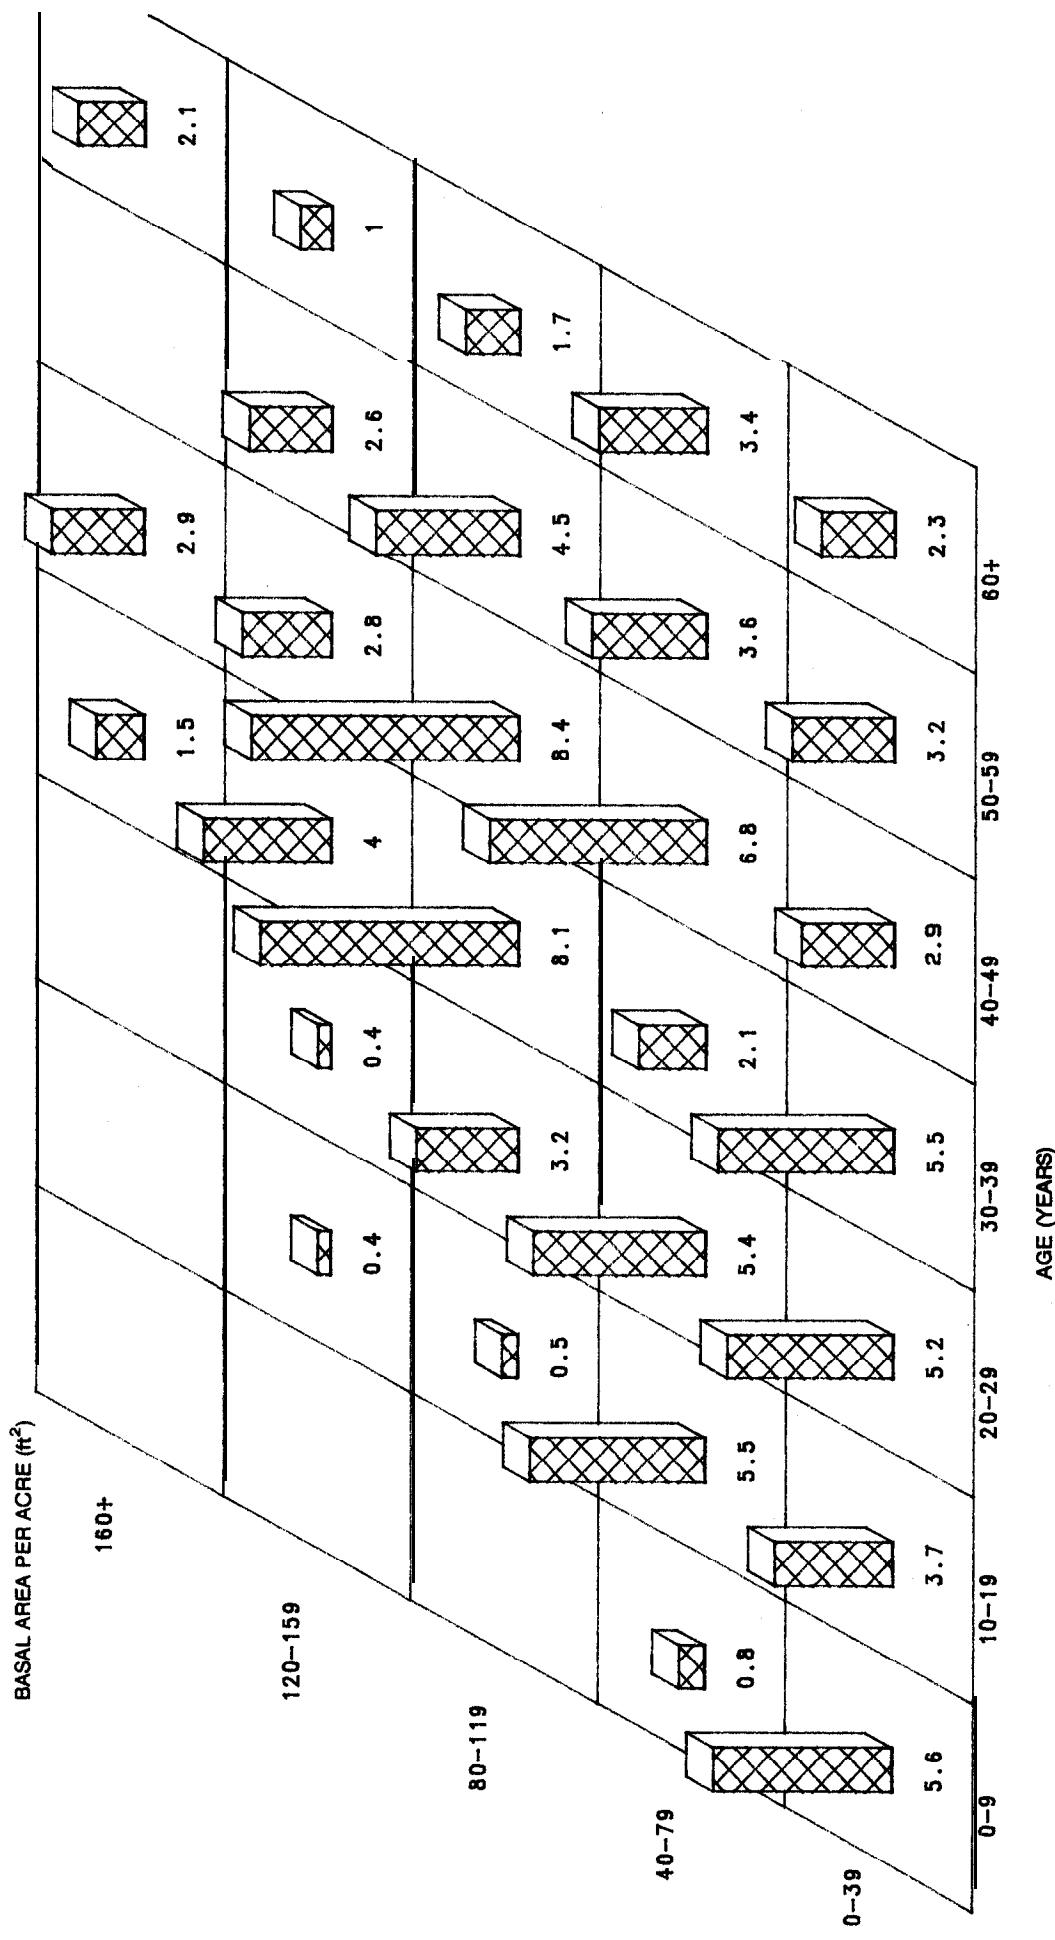

Figure 52B.—Percentage distribution of pond pine stands in North Carolina, by basal area per acre and stand age. (Represents 739,194 acres of natural stands, 3,666 acres of planted stands.)

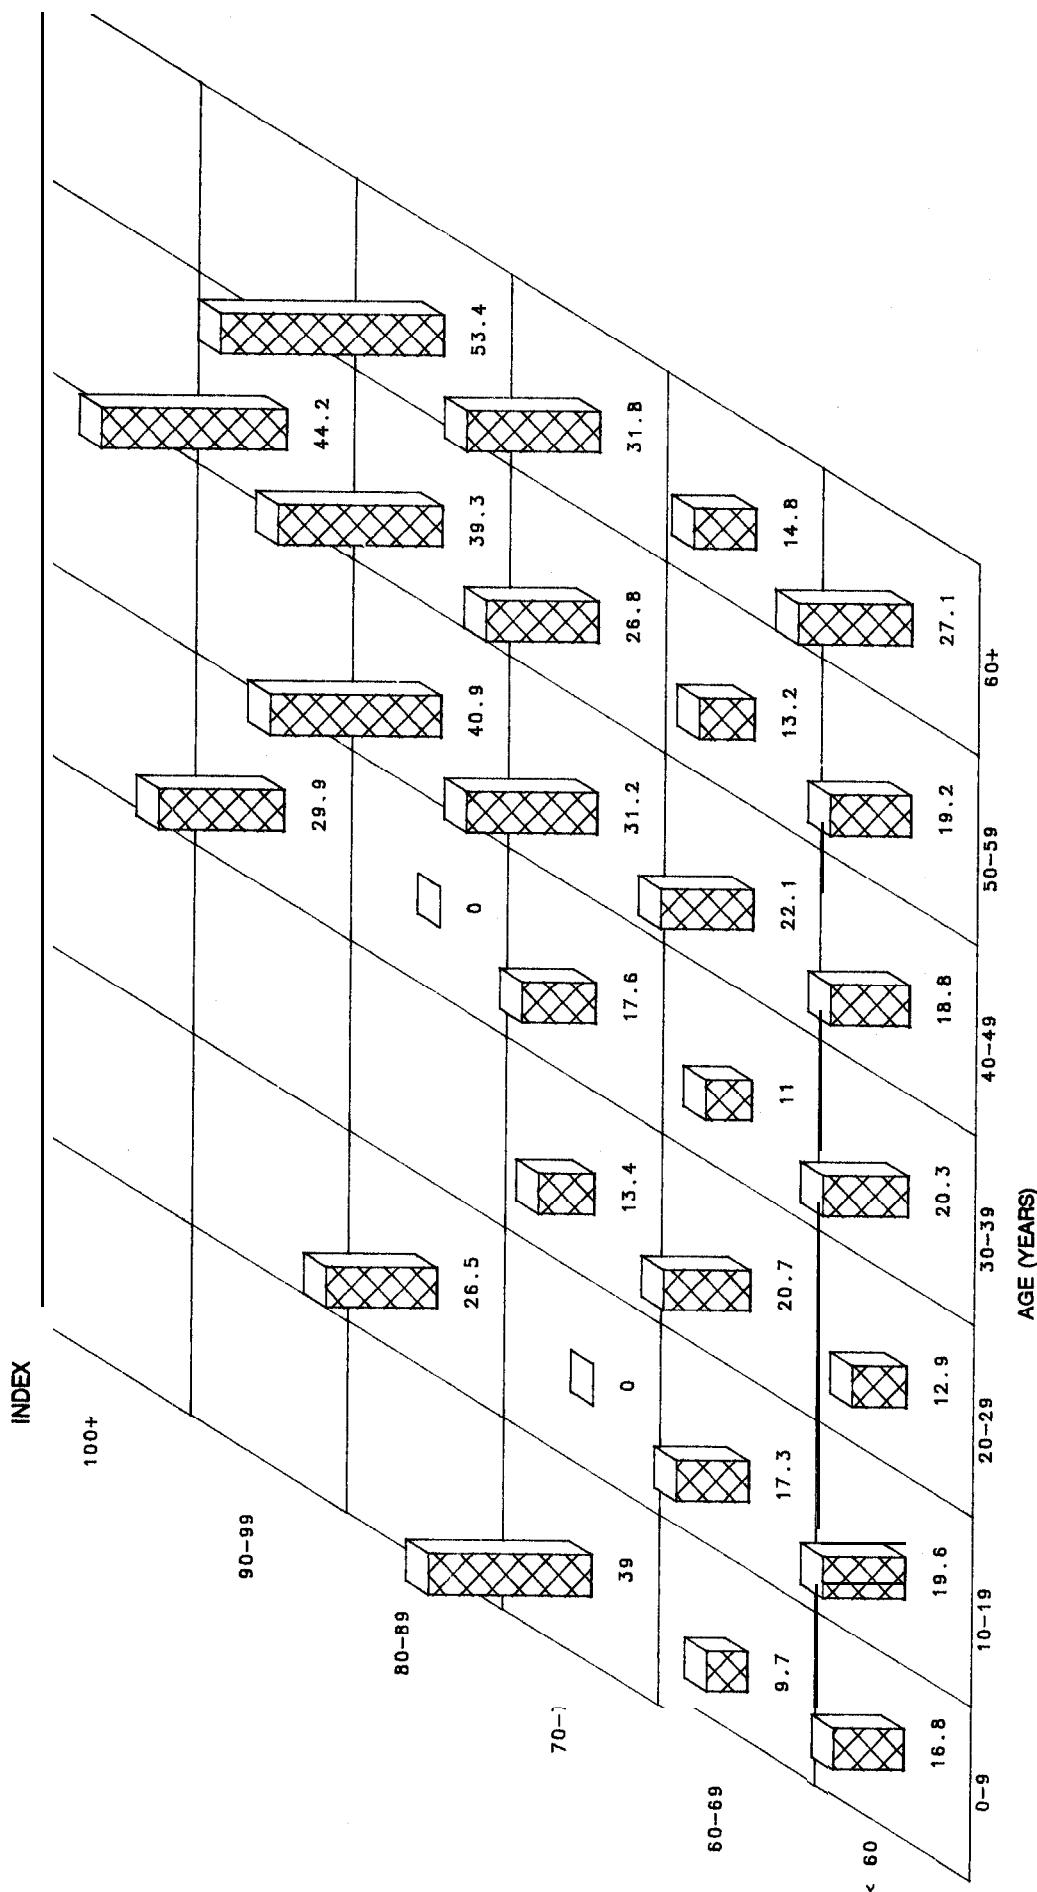

Figure 52C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for pond pine stands in North Carolina.
 (Represents 739,194 acres of natural stands, and 3,656 acres of planted stands.)

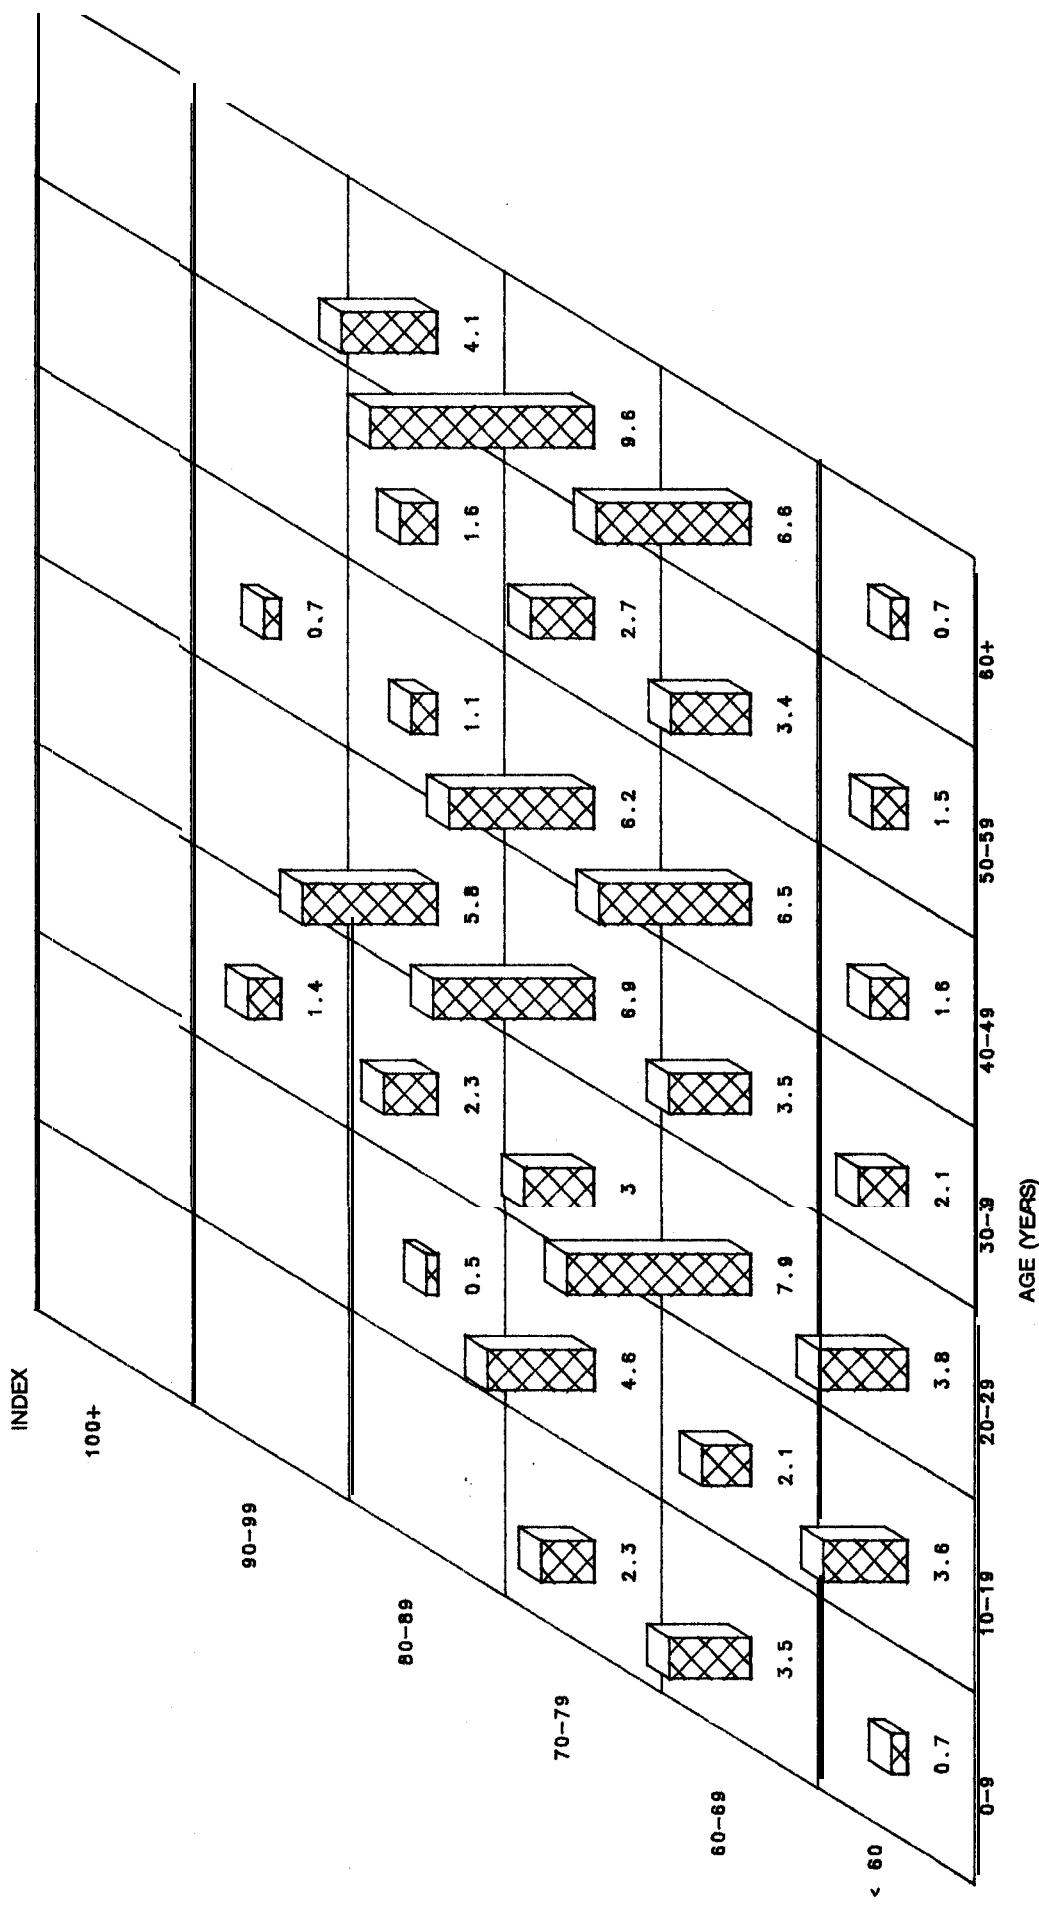

Figure 53A.—Percentage distribution of shortleaf pine stands in North Carolina, by site index and stand age. (Represents 494,410 acres of natural stands, 8,491 acres of planted stands.)

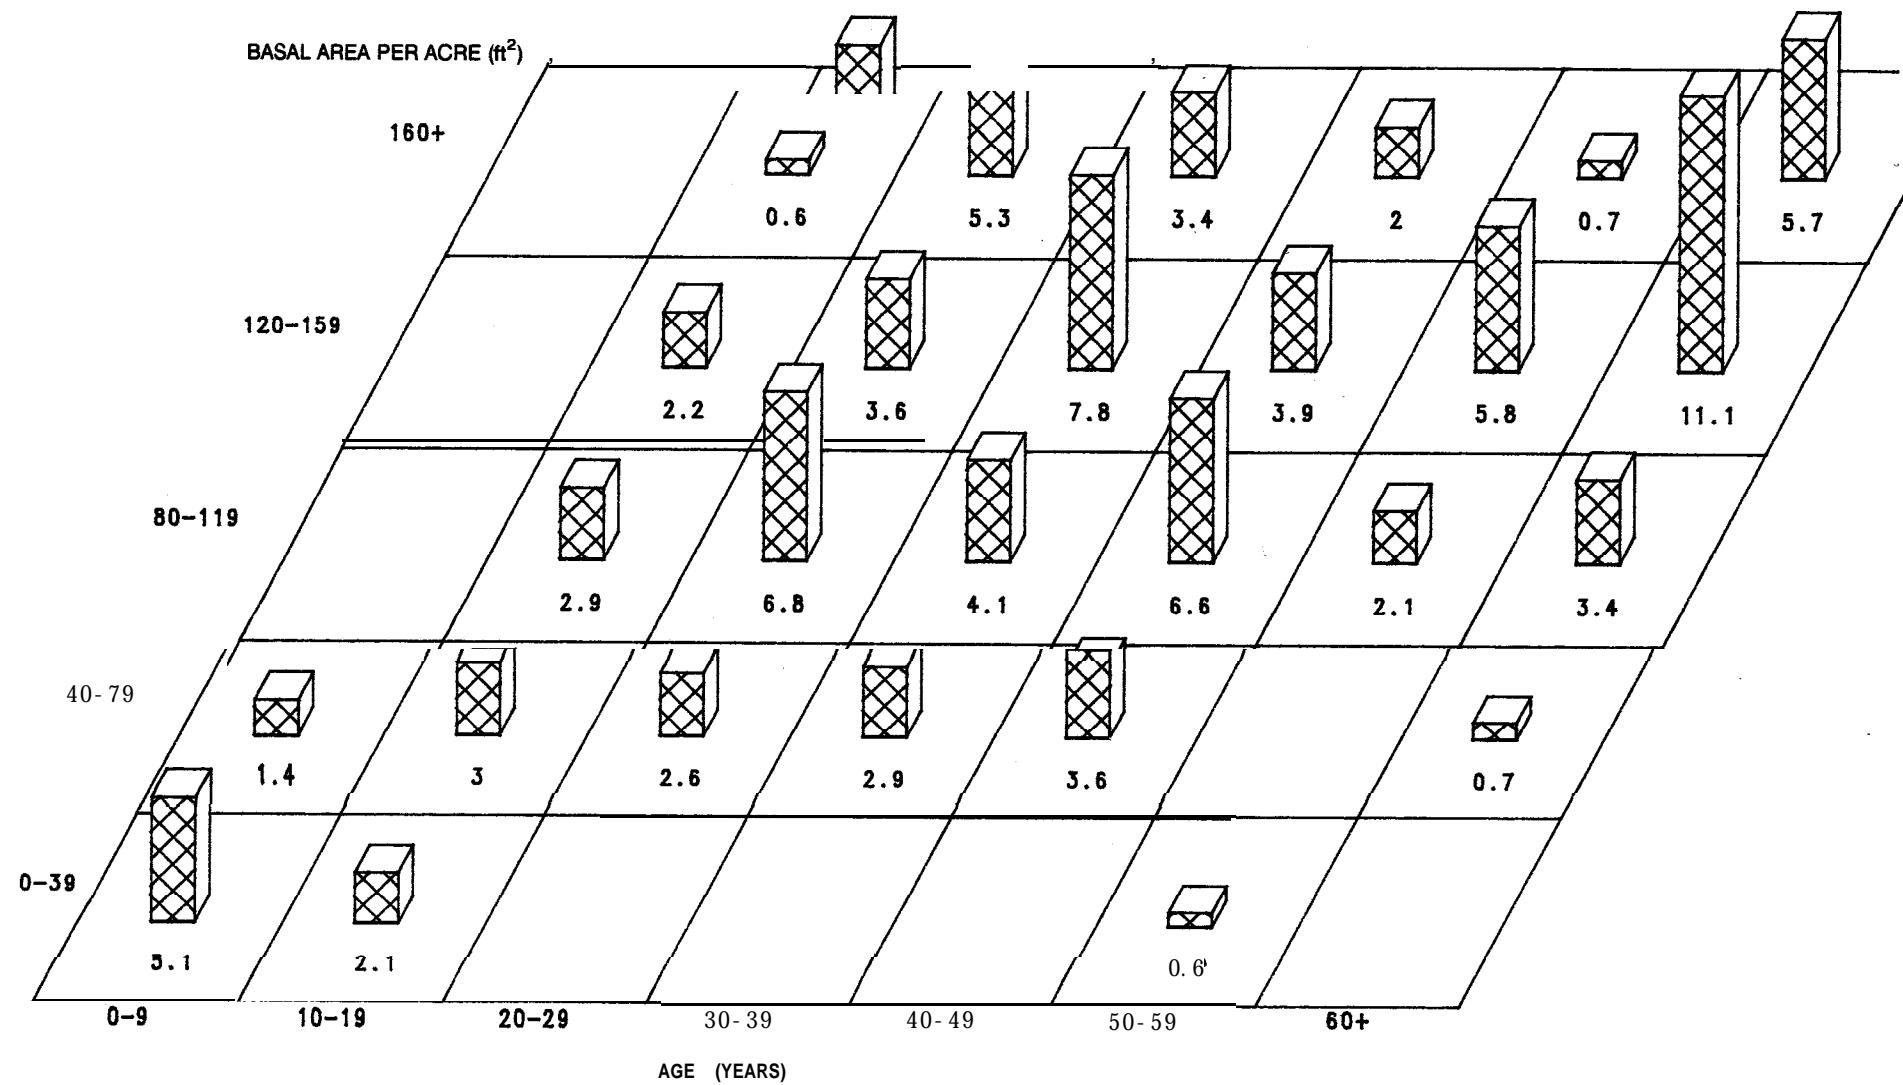

Figure 53B.—Percentage distribution of shortleaf pine stands in North Carolina, by basal area per acre and stand age. (Represents 494,410 acres of natural stands, and 8,481 acres of planted stands.)

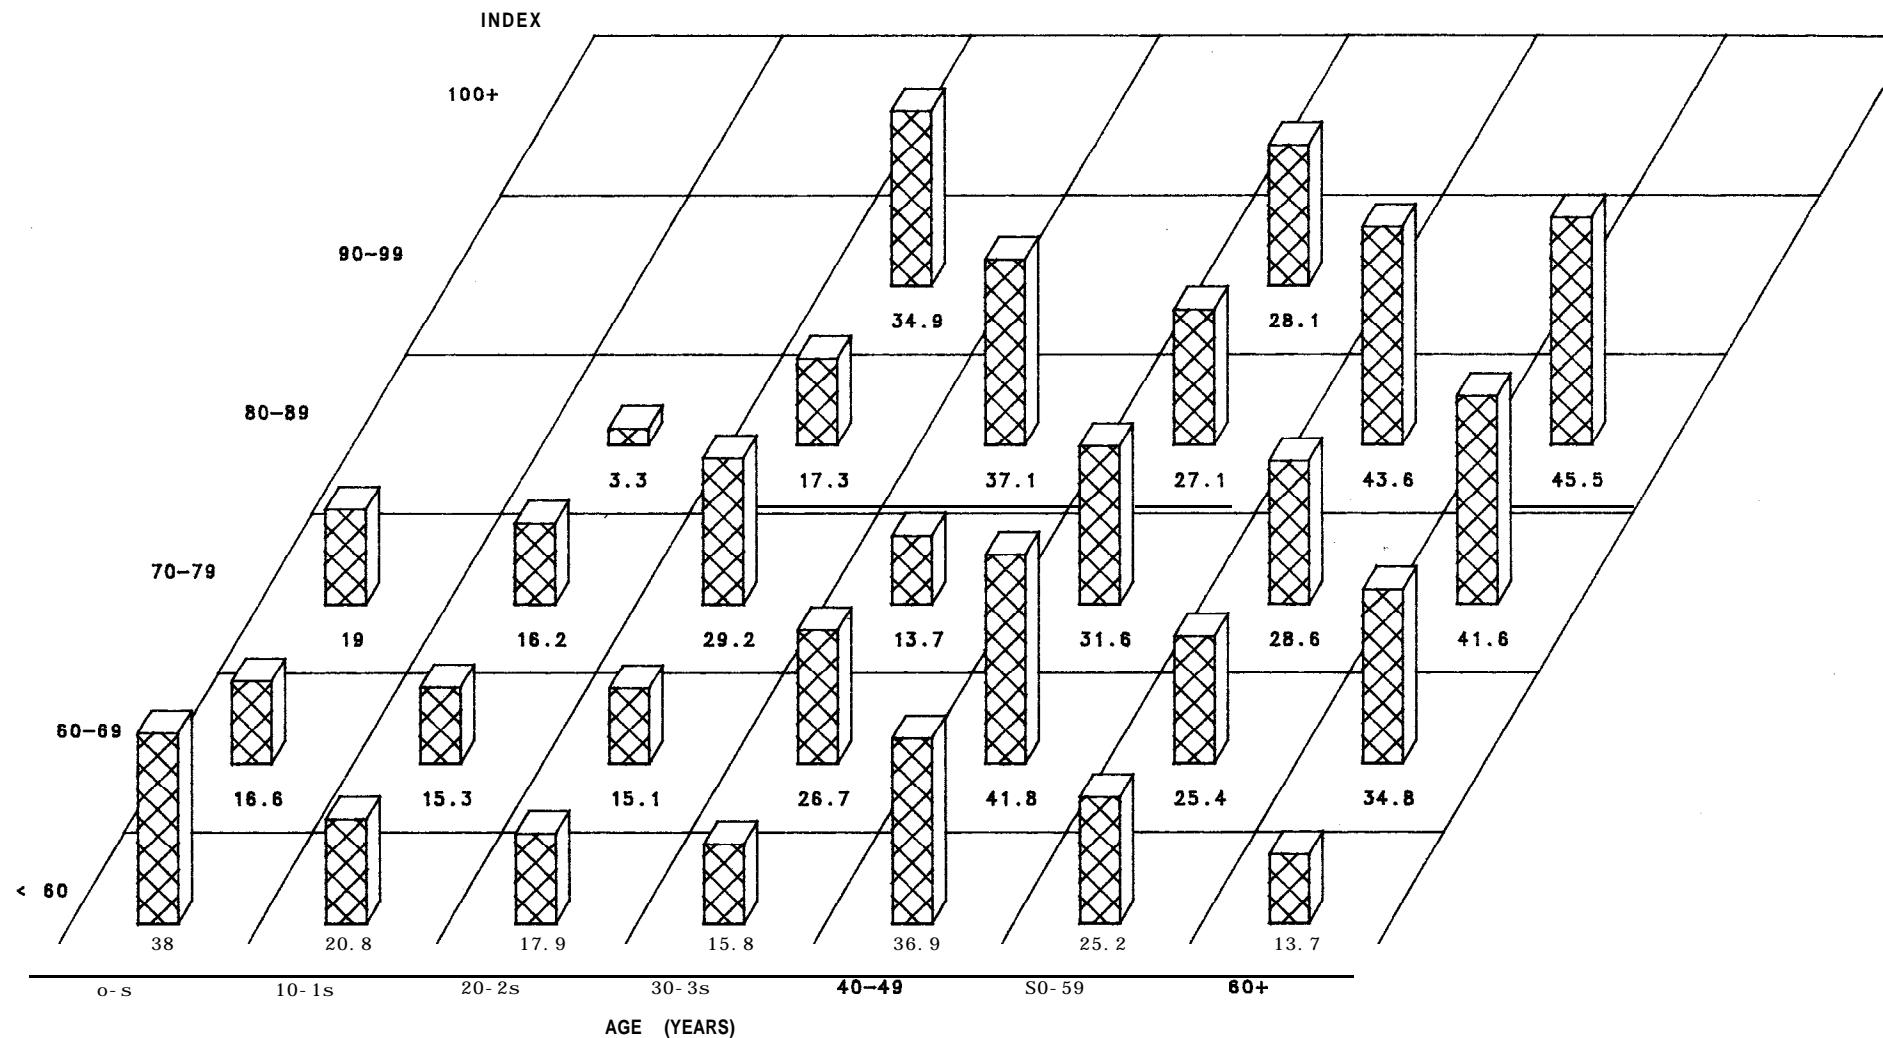

Figure 53C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for shortleaf pine stands in North Carolina
 (Represents 494,410 acres of natural stands, and 8,491 acres of planted stands.)

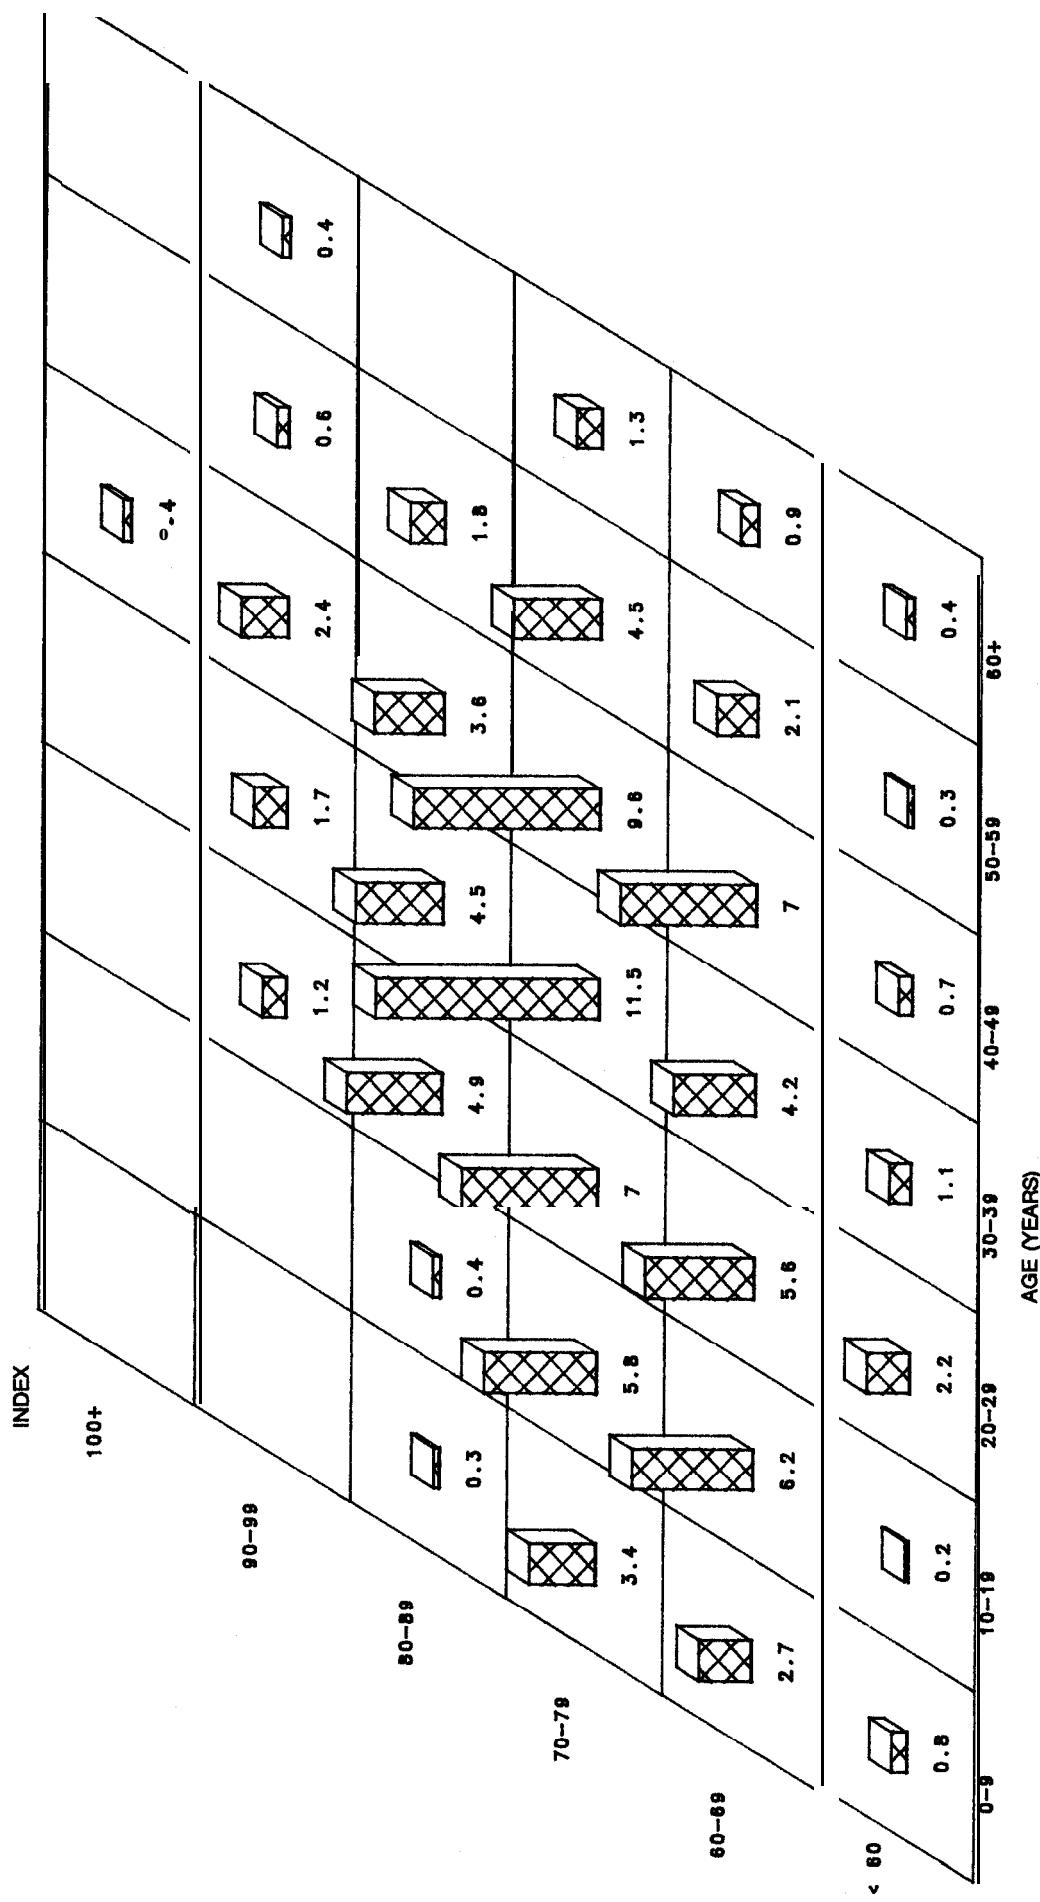

Figure 54A.—Percentage distribution of Virginia pine stands in North Carolina, by site index and stand age. (Represents 779,881 acres of natural stands, and 136 acres of planted stands.)

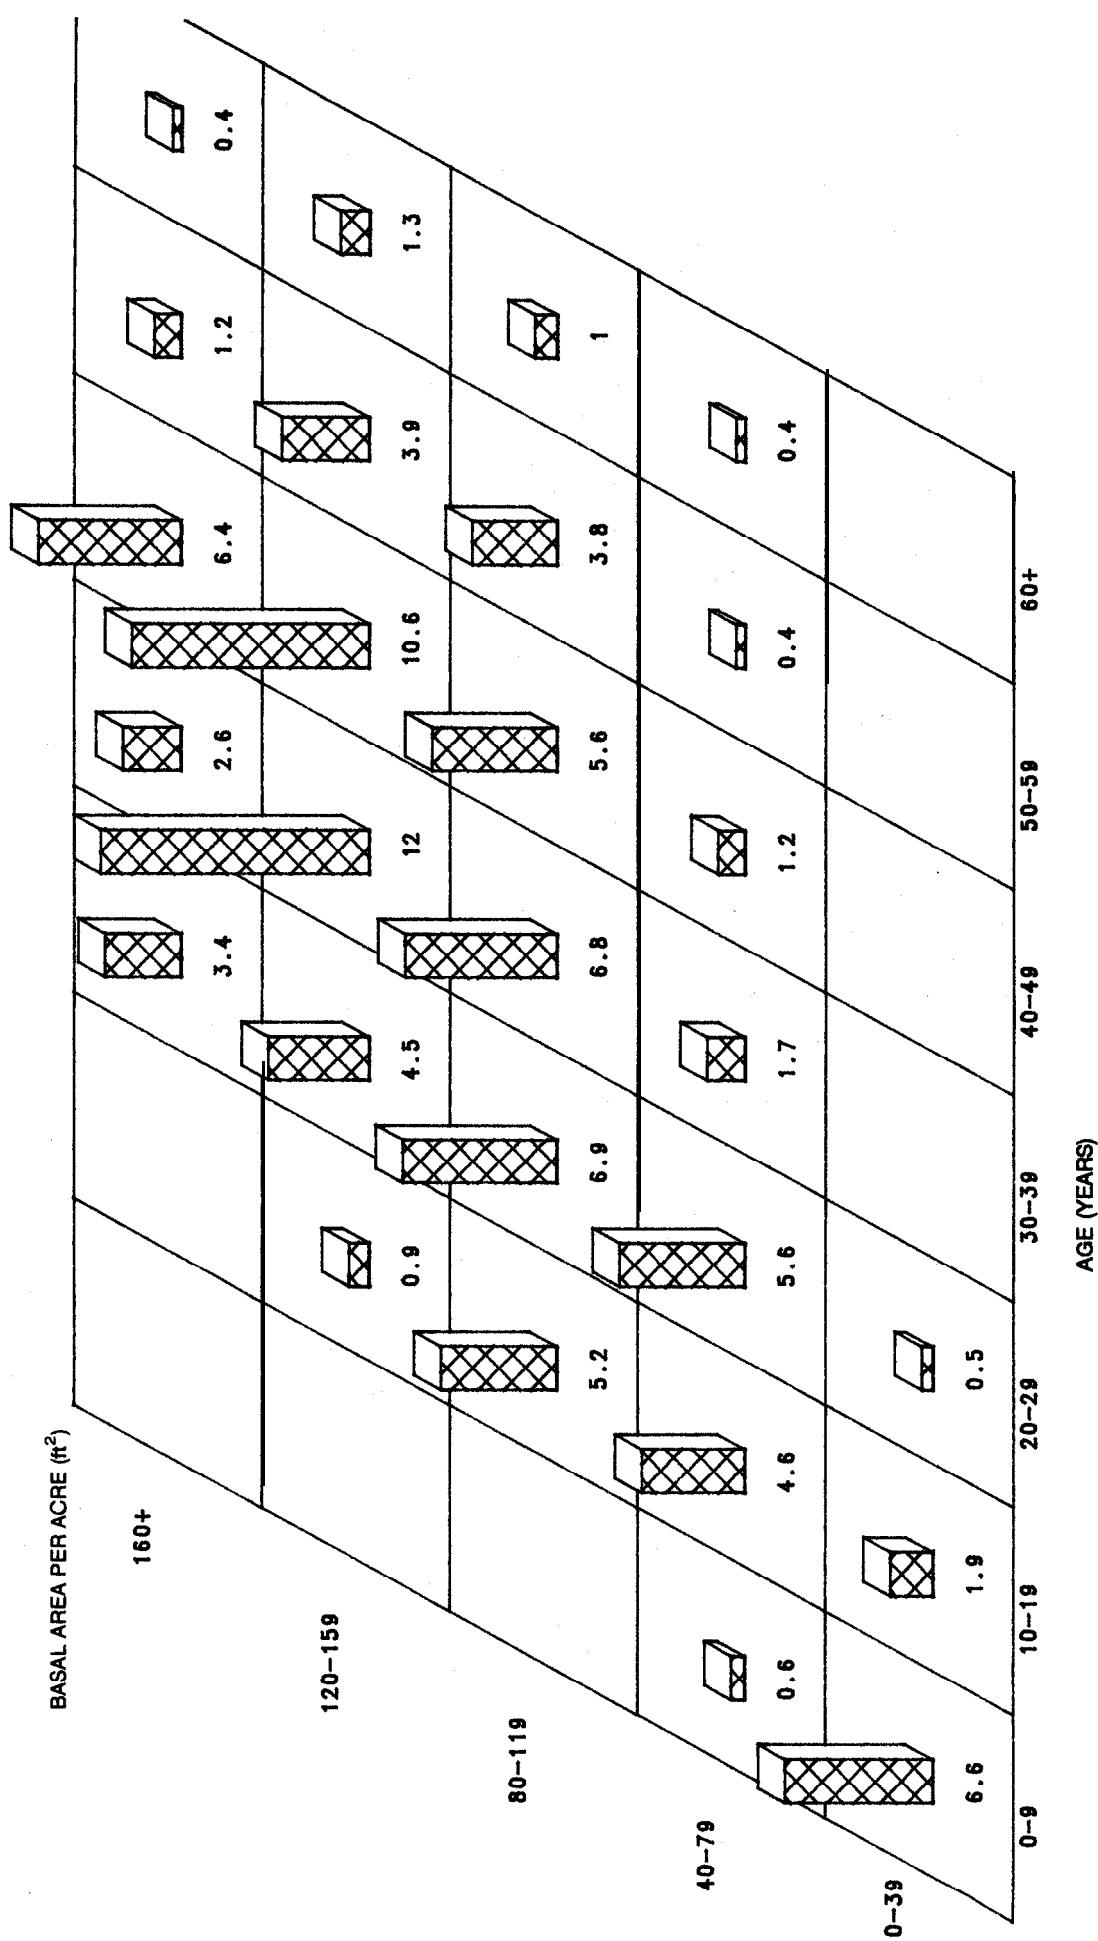

Figure 54B.—Percentage distribution of Virginia pine stands in North Carolina, by basal area per acre and stand age. (Represents 779,881 acres of natural stands, and 136 acres of planted stands.)

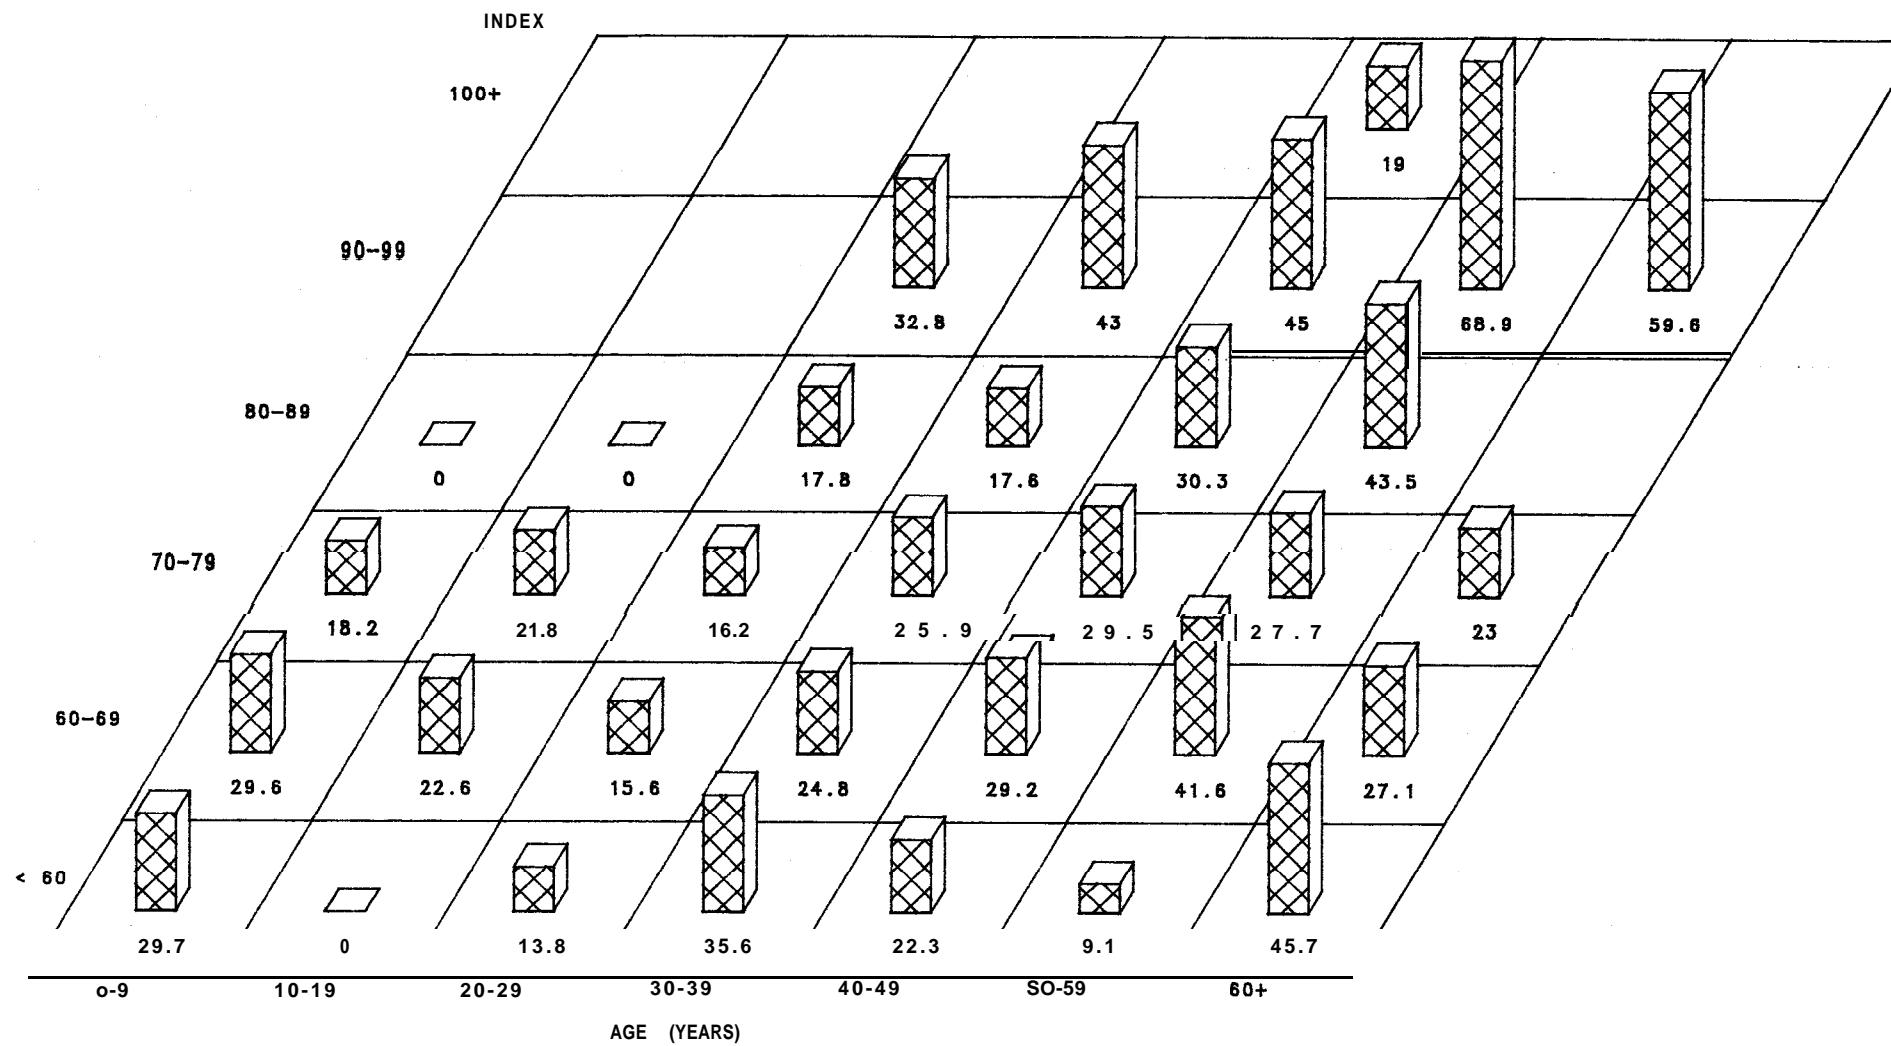

Figure 54C.--Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for Virginia pine stands in North Carolina.
(Represents 779,881 acres of natural stands, and 136 acres of planted stands.)

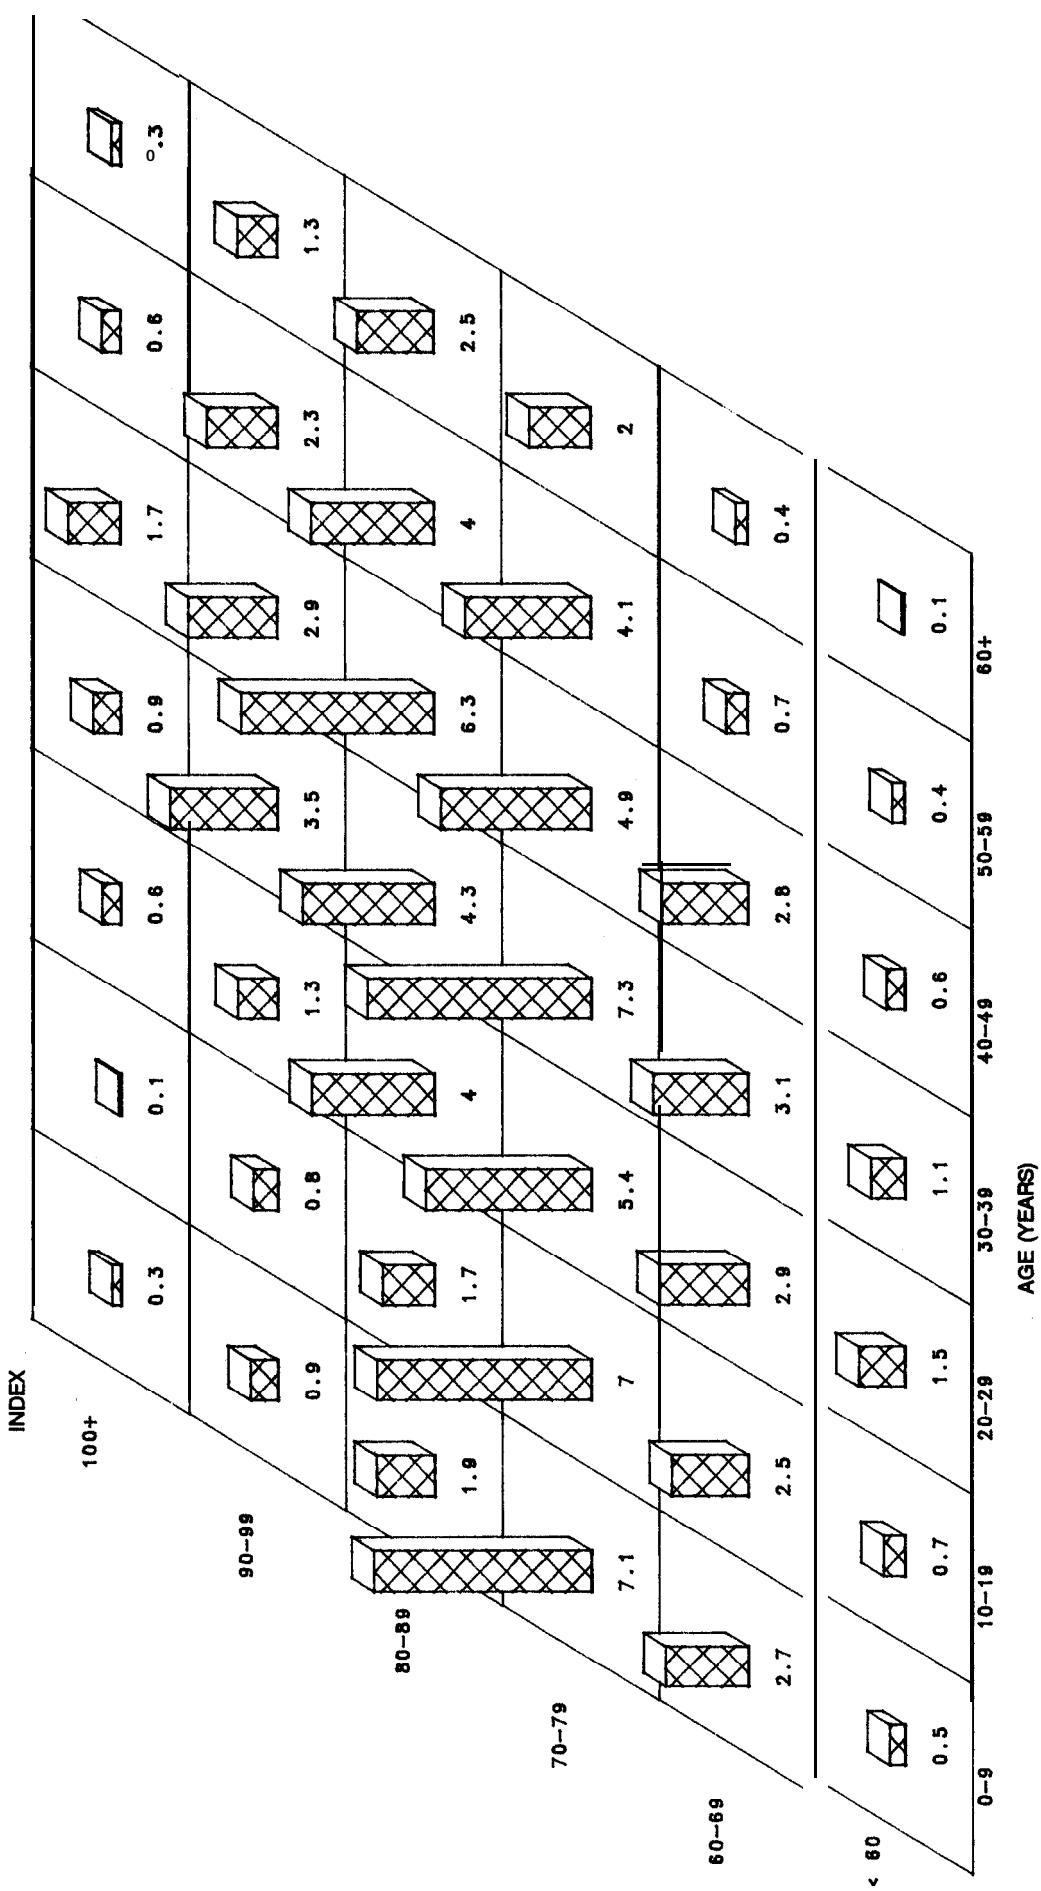

Figure 55A.—Percentage distribution of natural loblolly pine stands in South Carolina, by site index and stand age. (Represents 2,234,714 acres.)

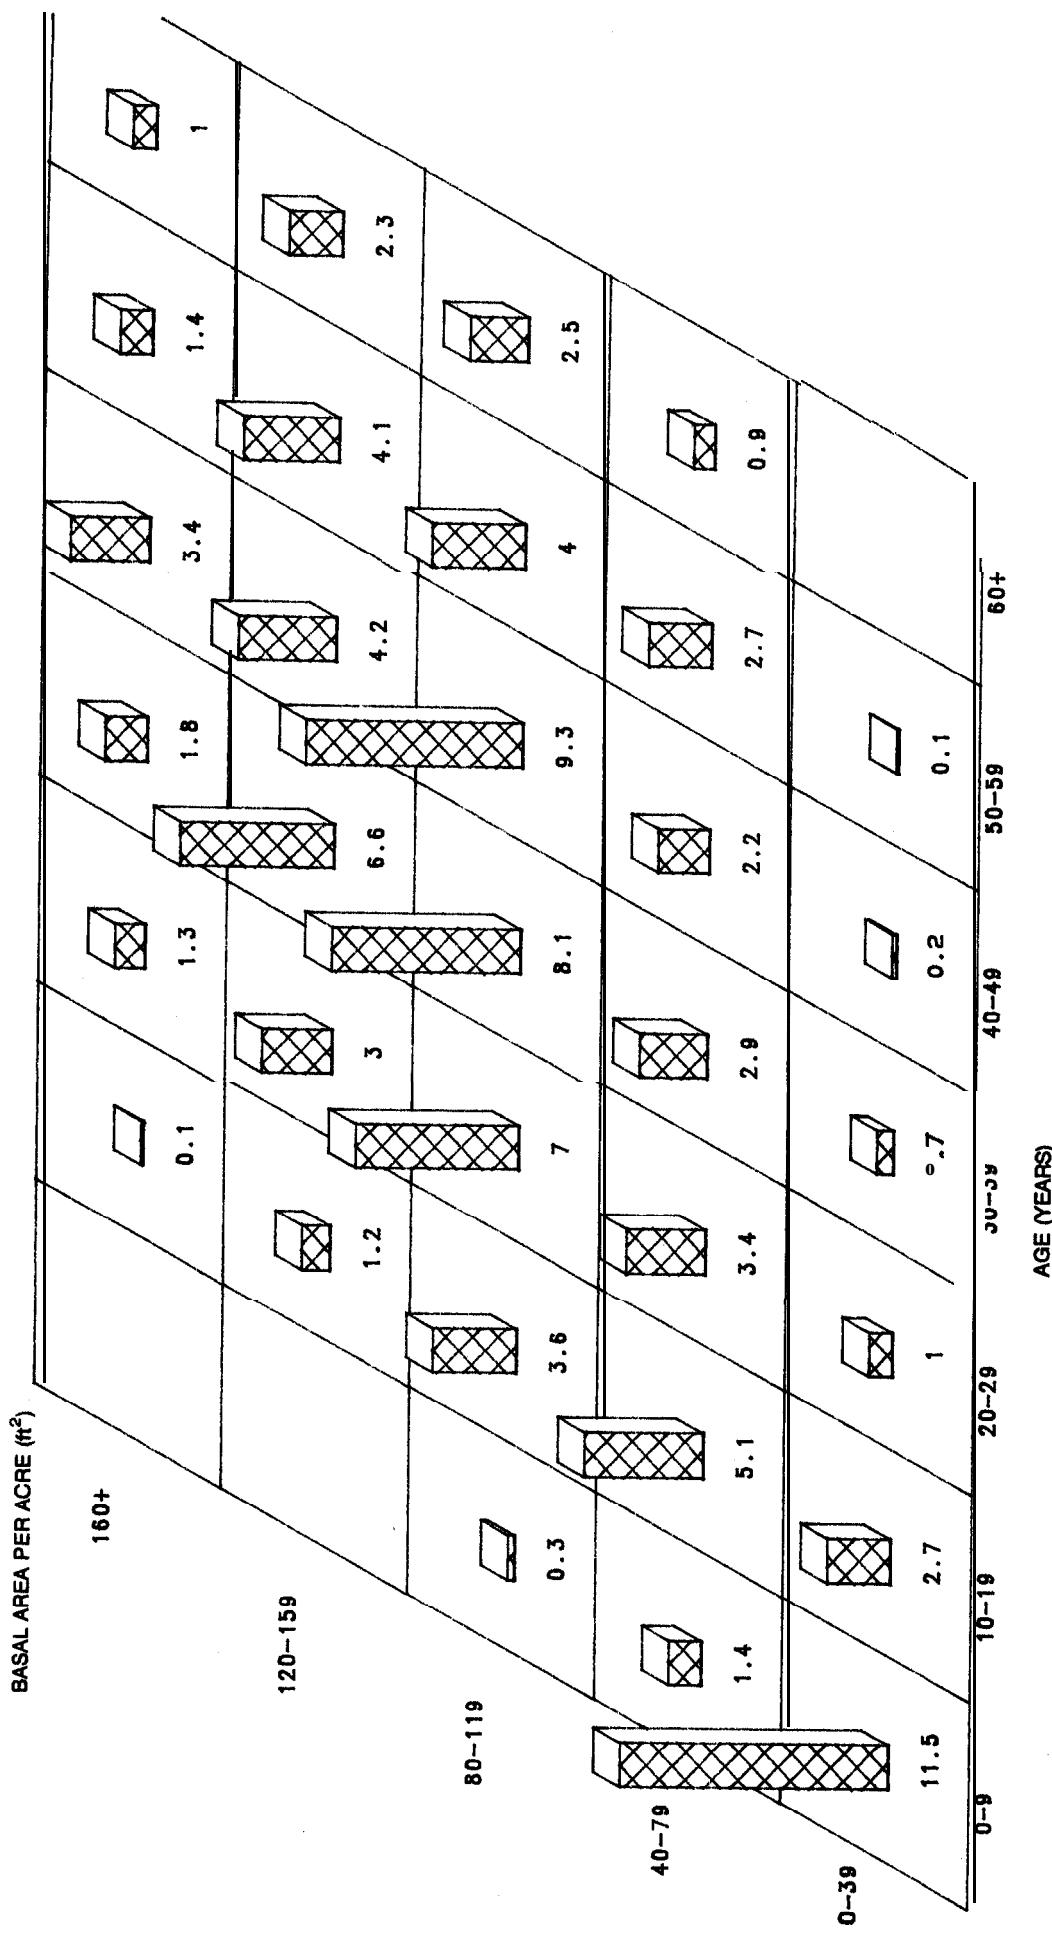

Figure 55B.—Percentage distribution of natural loblolly pine stands in South Carolina, by basal area per acre and stand age. (Represents 2,234,714 acres.)

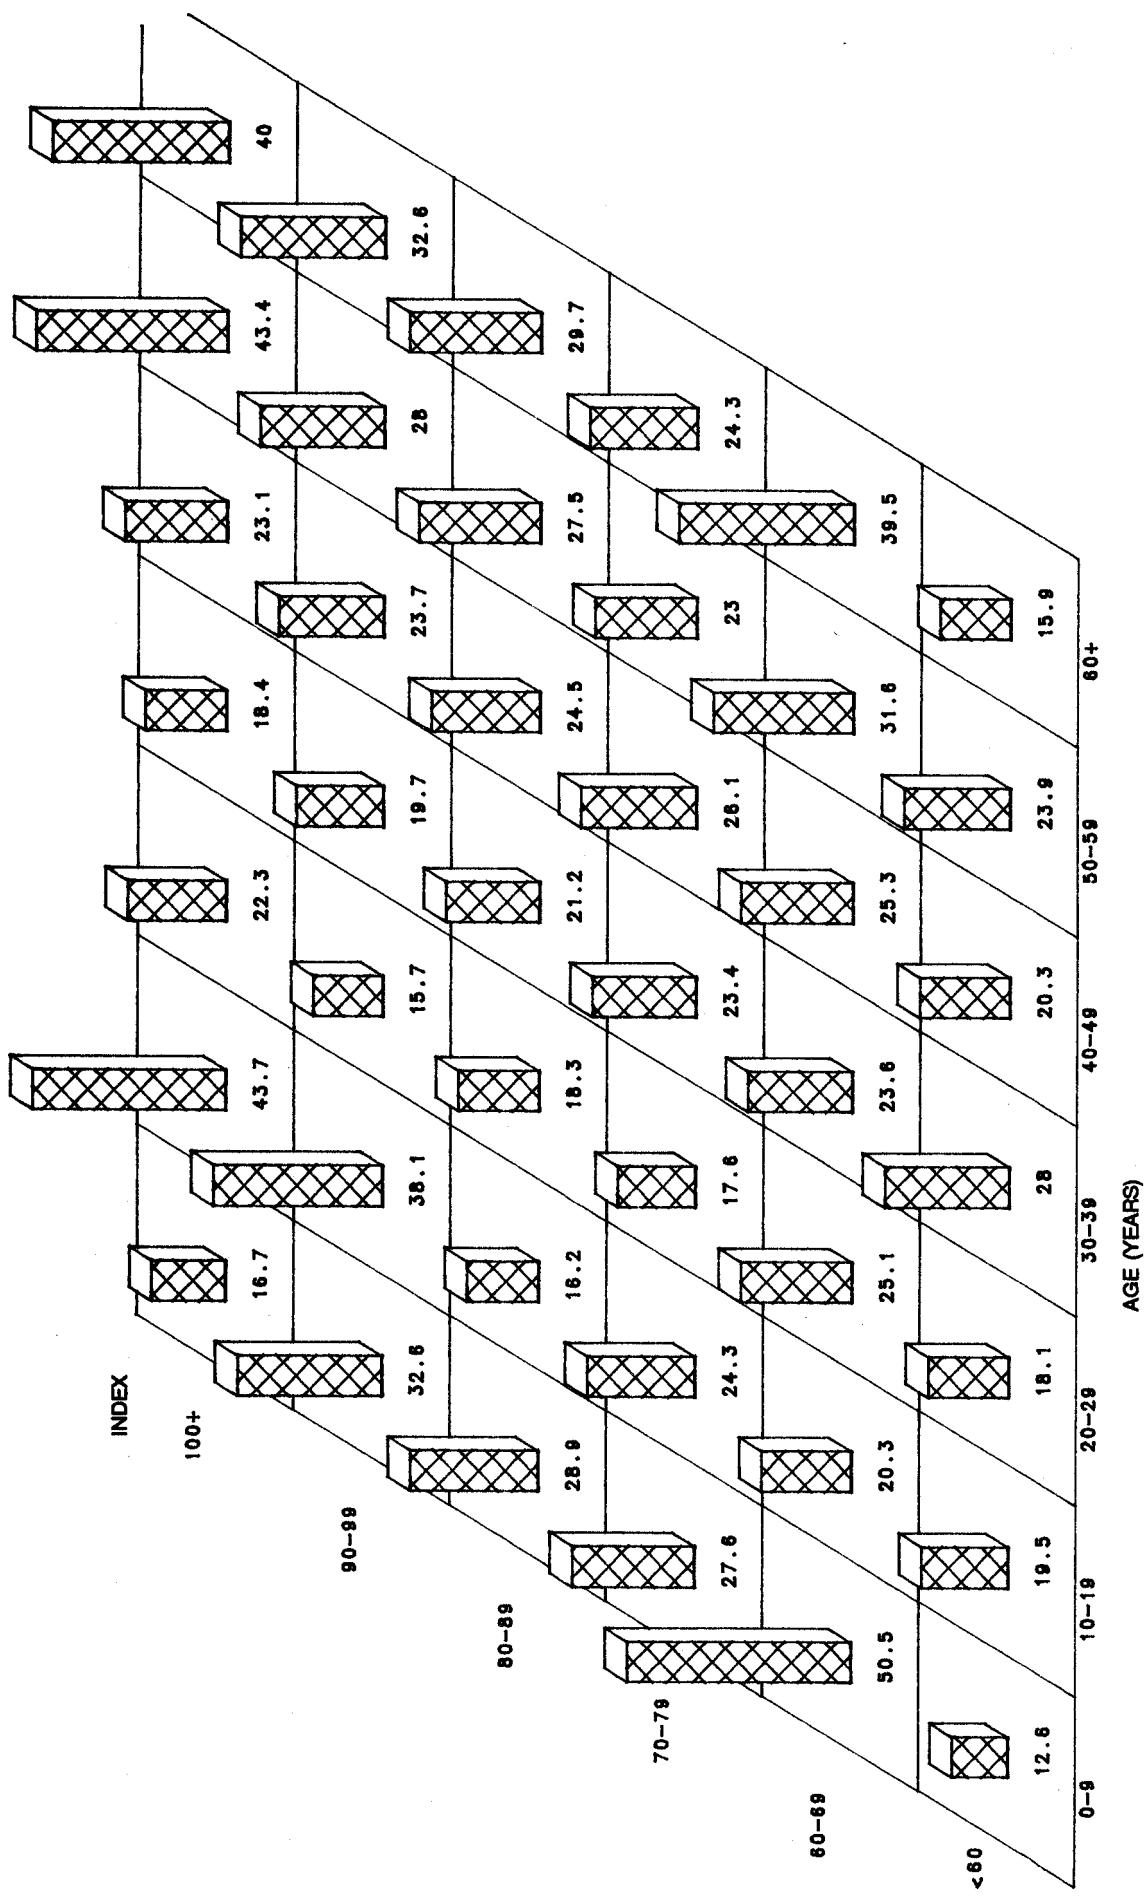

Figure 55C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for natural loblolly pine stands in South Carolina. (Represents 2,234,714 acres.)

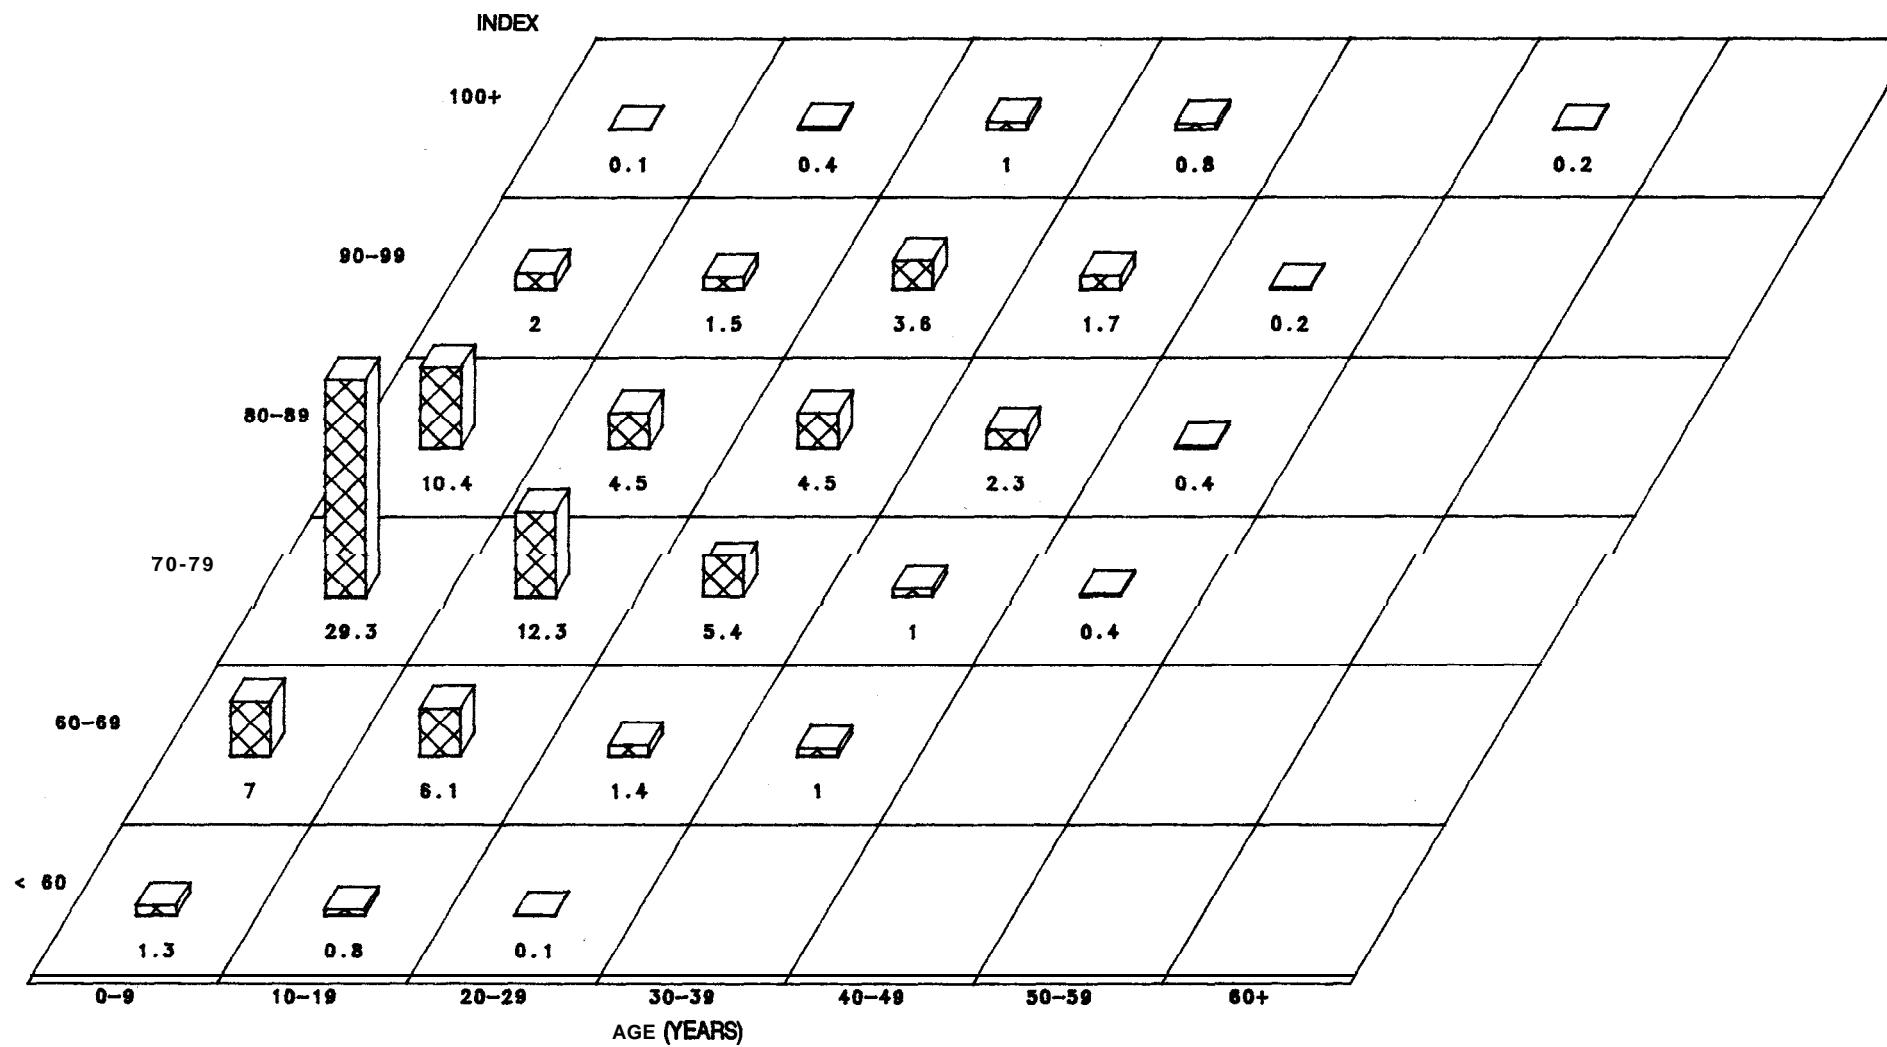

Figure --Percentage distribution of planted loblolly pine stands in South Carolina, by site index and stand age. (Represents 1,635,752 acres.)

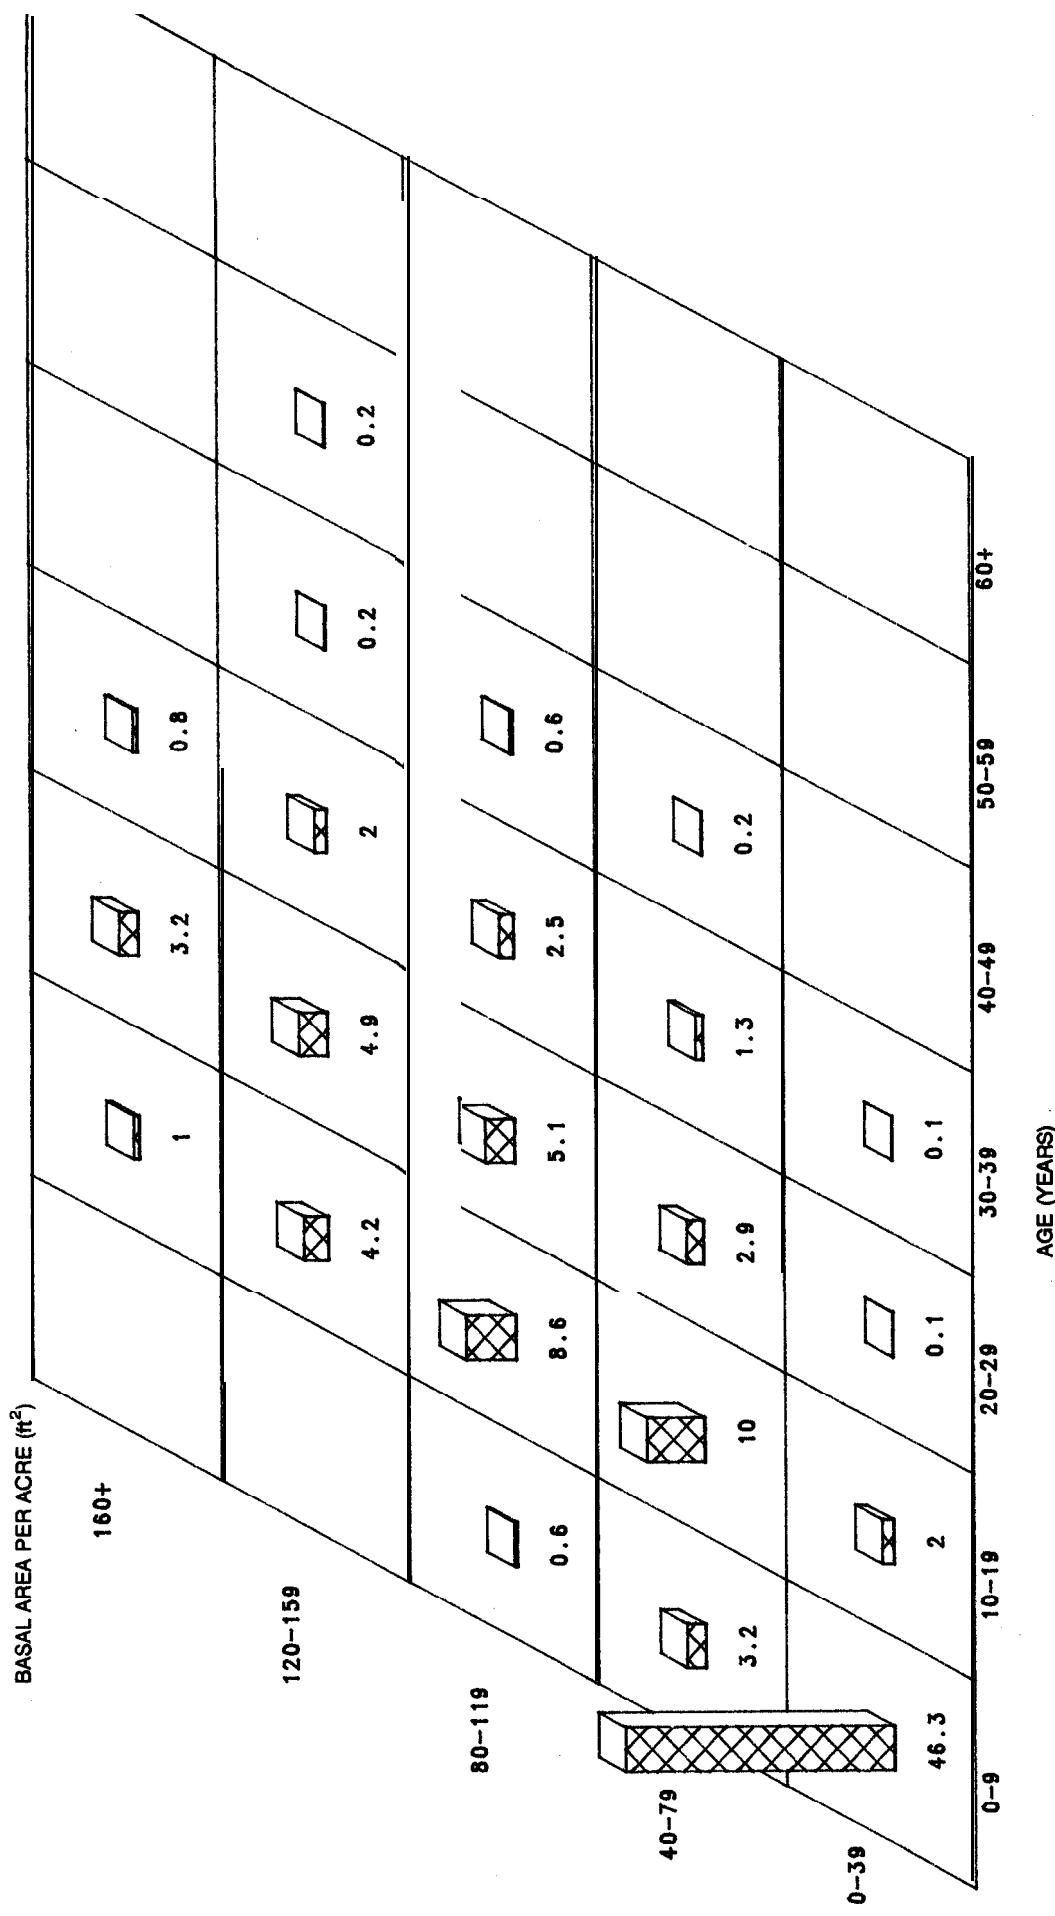

Figure 56B.—Percentage distribution of planted loblolly pine stands in South Carolina, by basal area per acre and stand age. (Represents 1,635,752 acres.)

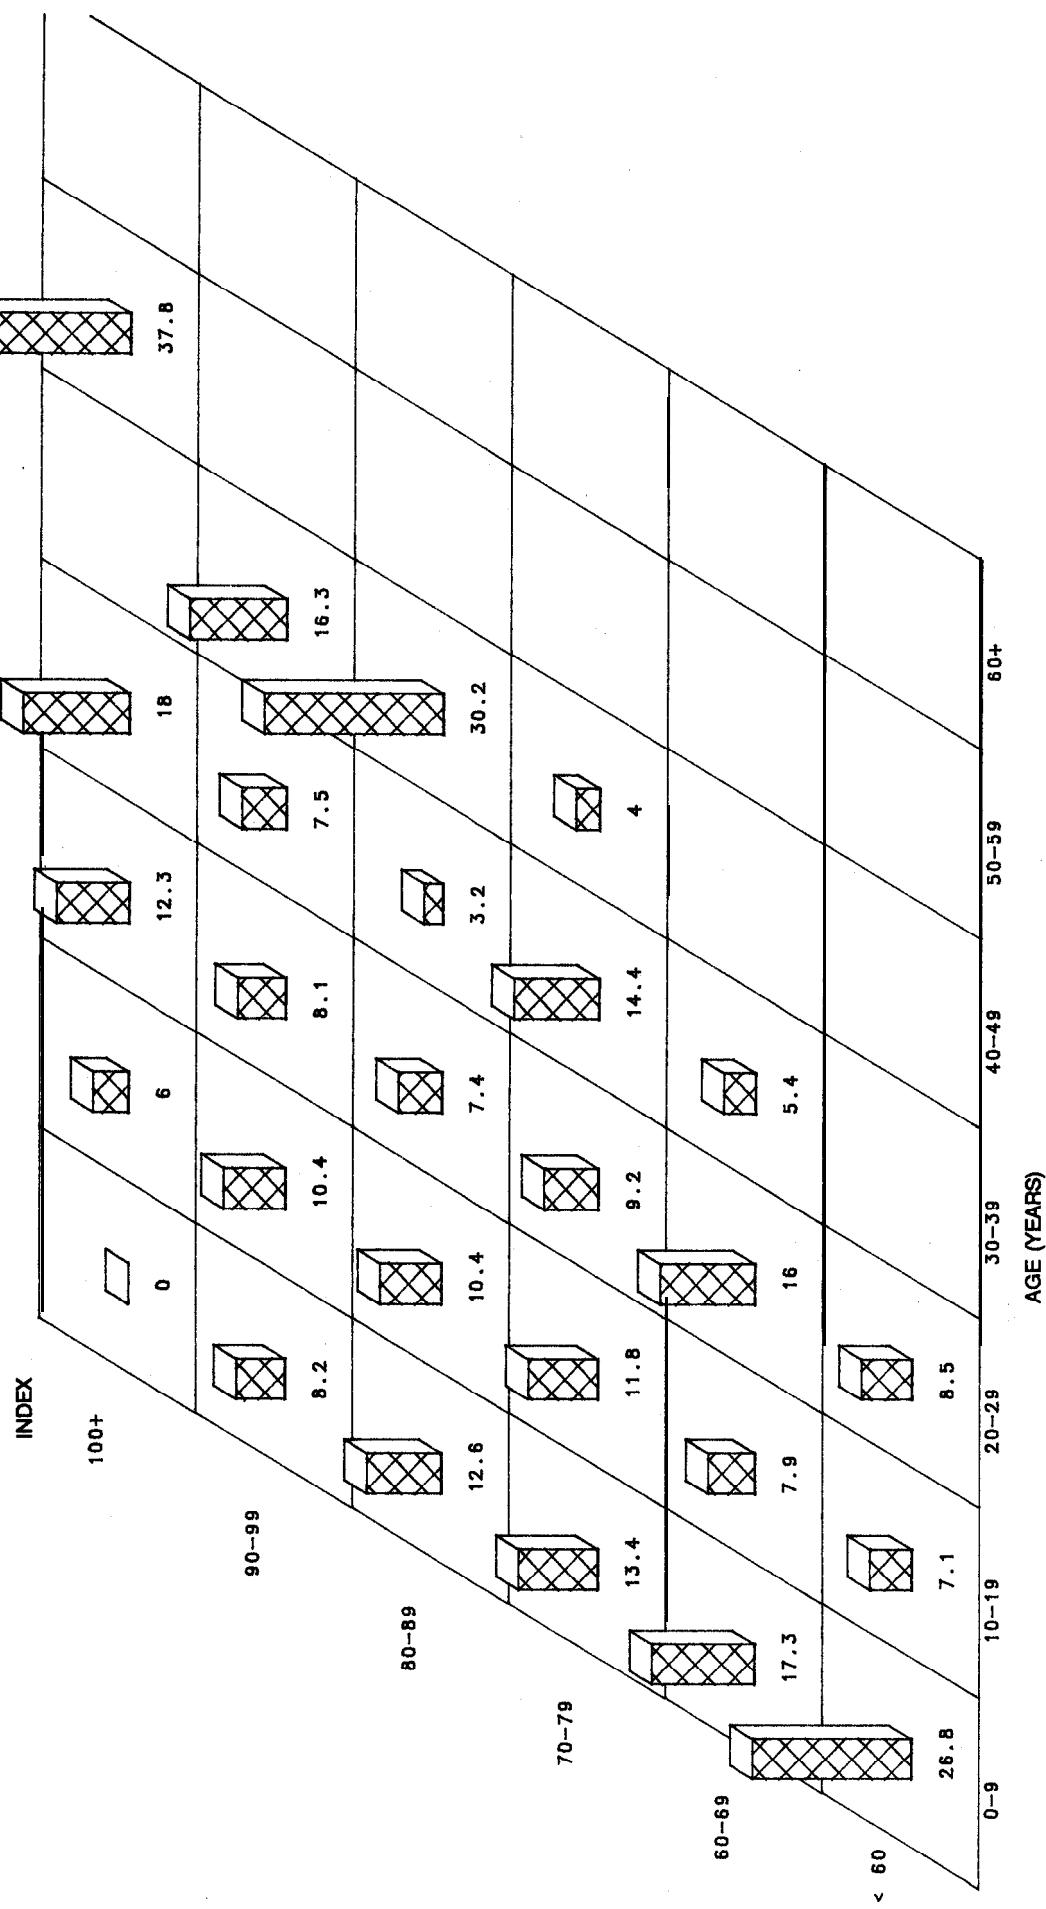

Figure 56C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for planted loblolly pine stands in South Carolina. (Represents 1,635,752 acres.)

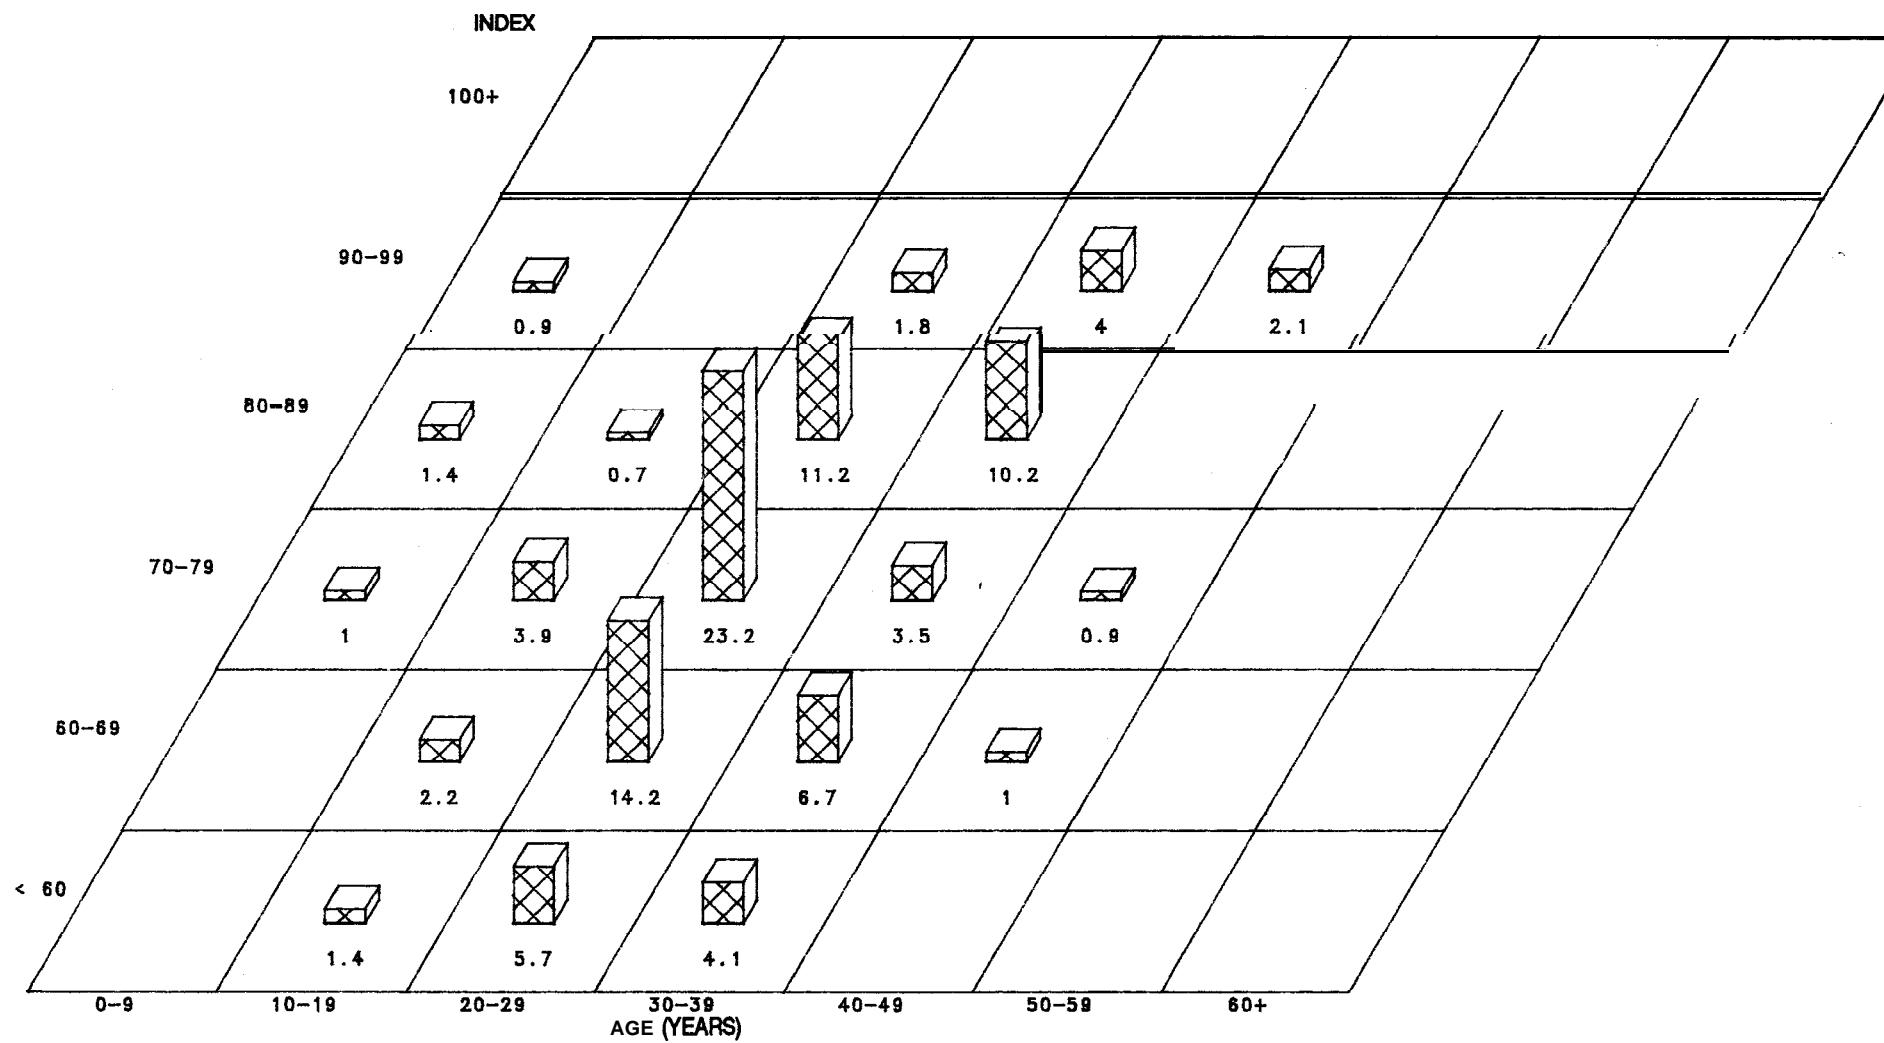

Figure 57A.—Percentage distribution of planted slash pine stands in South Carolina, by site index and stand age. (Represents 304,579 acres.)

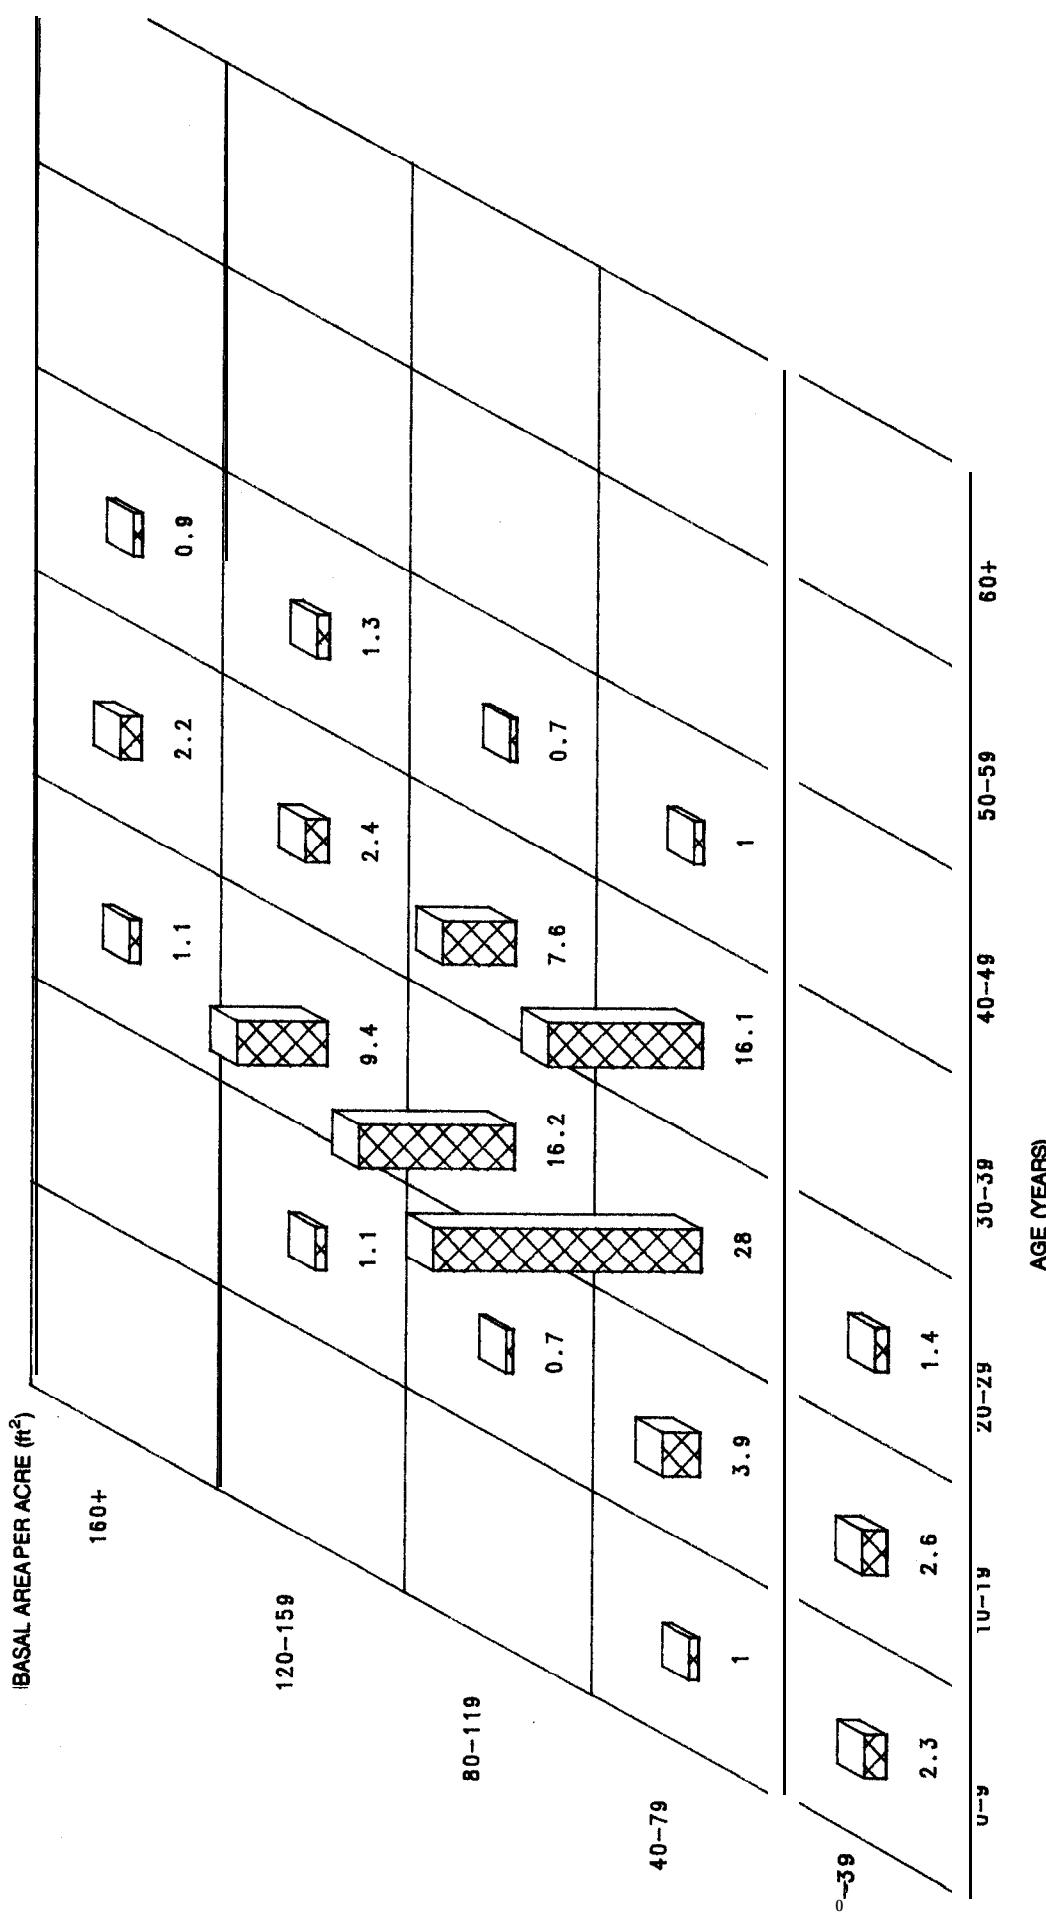

Figure 57B.—Percentage distribution of planted slash pine stands in South Carolina, by basal area per acre and stand age. (Represents 304,579 acres.)

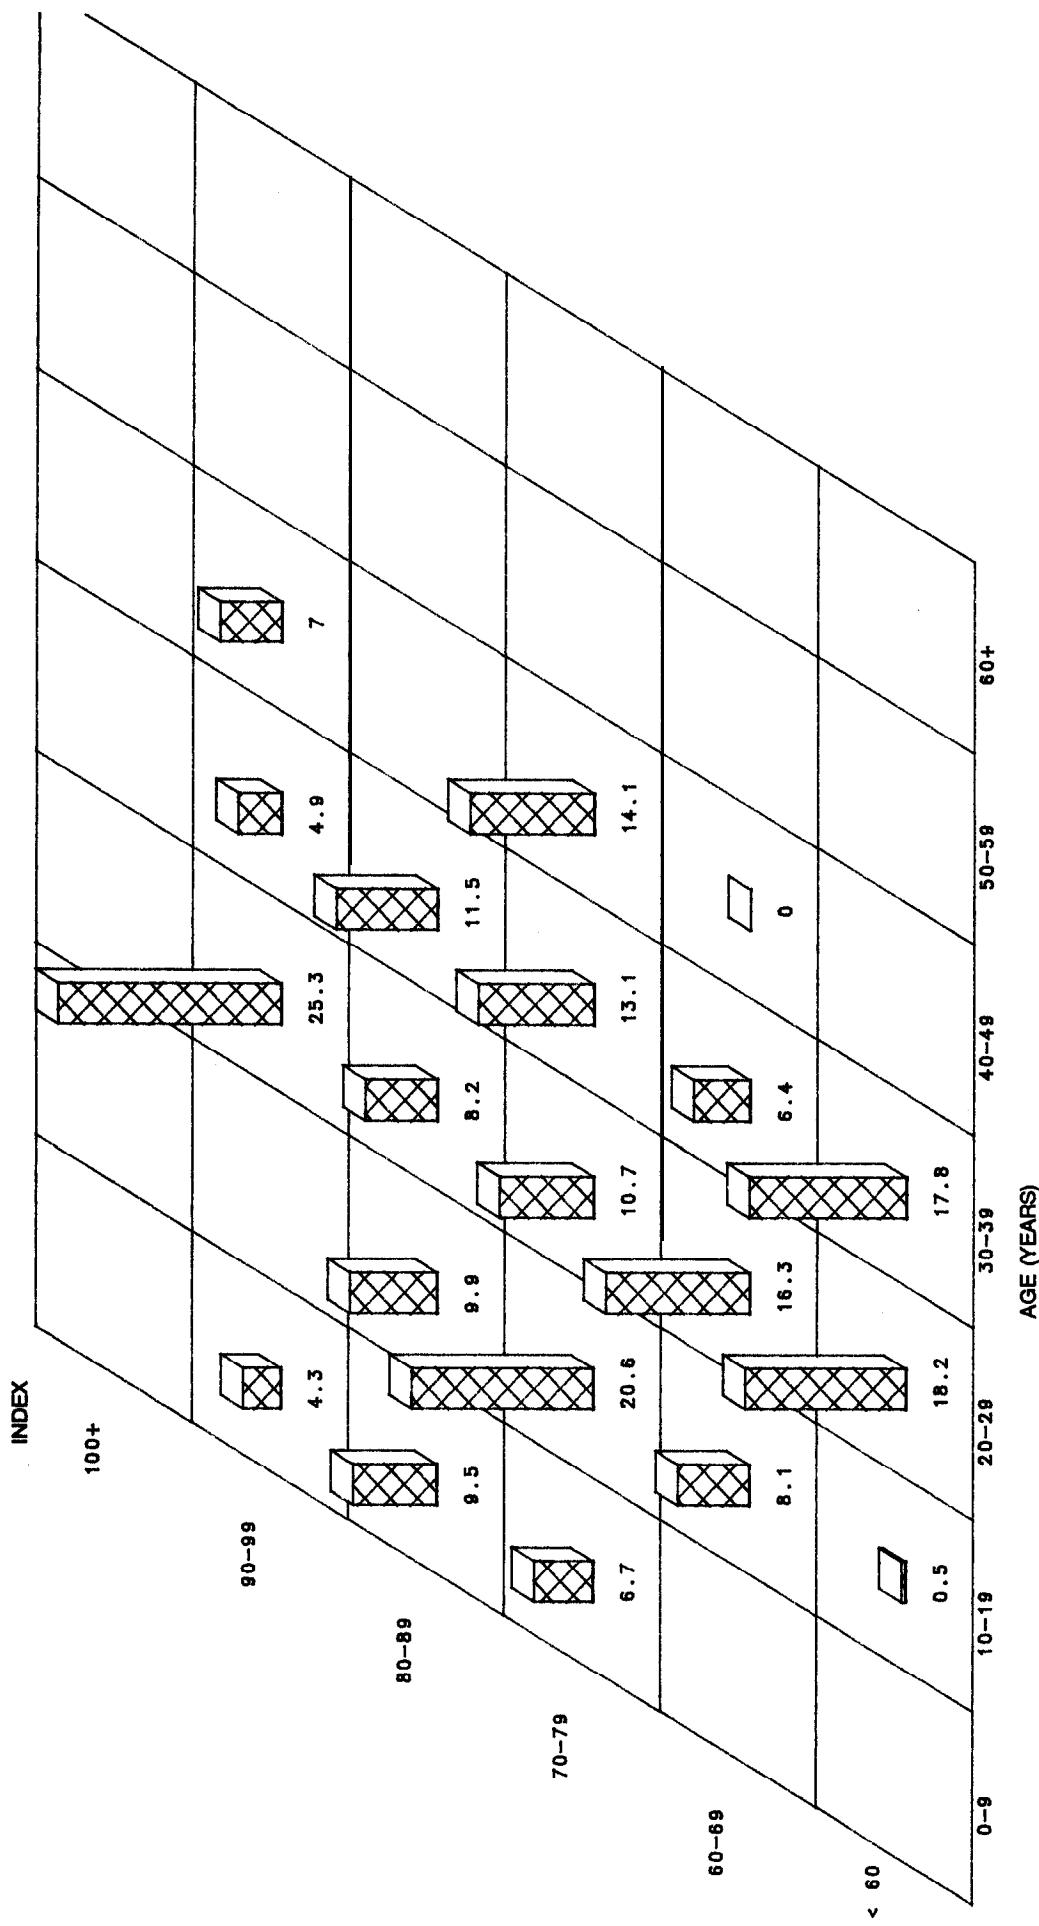

Figure 57C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for planted slash pine stands in South Carolina. (Represents 304,579 acres.)

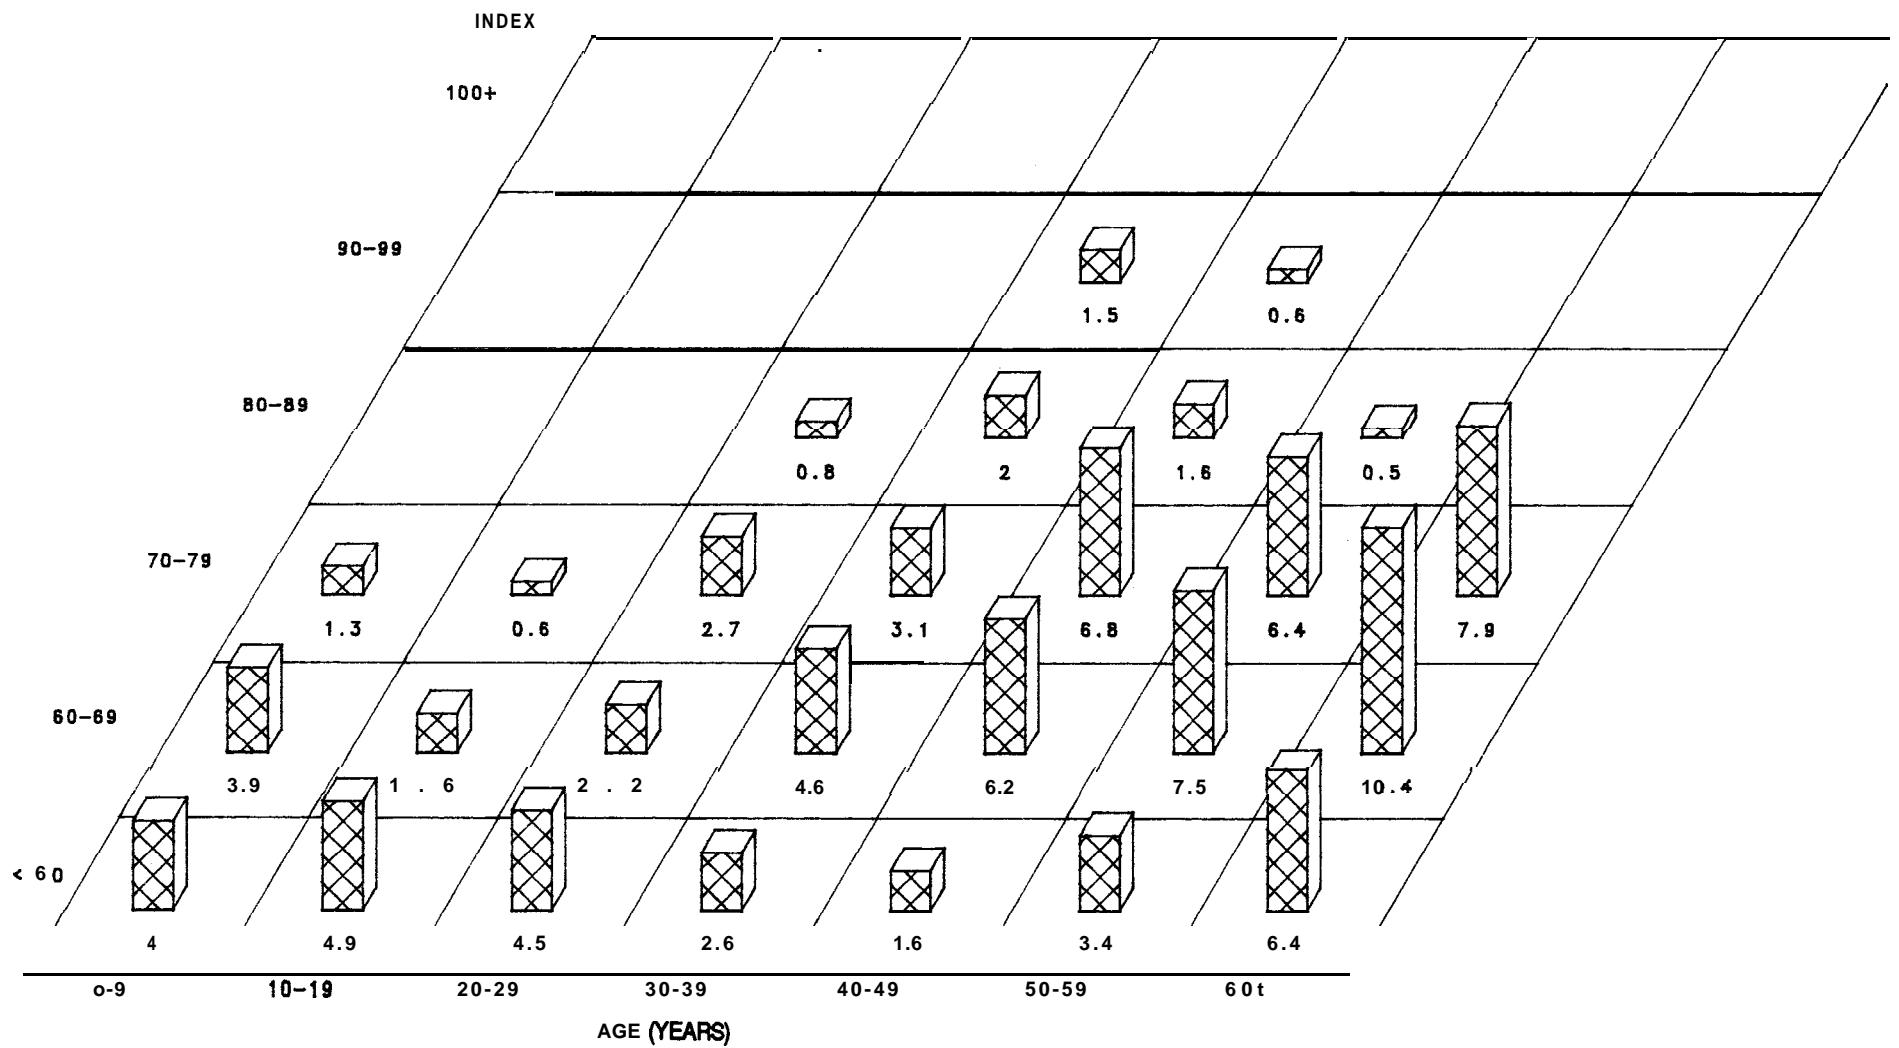

Figure 58A.—Percentage distribution of longleaf pine stands in South Carolina, by site index and stand age. (Represents 345,145 acres of natural stands, and 51,326 acres of planted stands.)

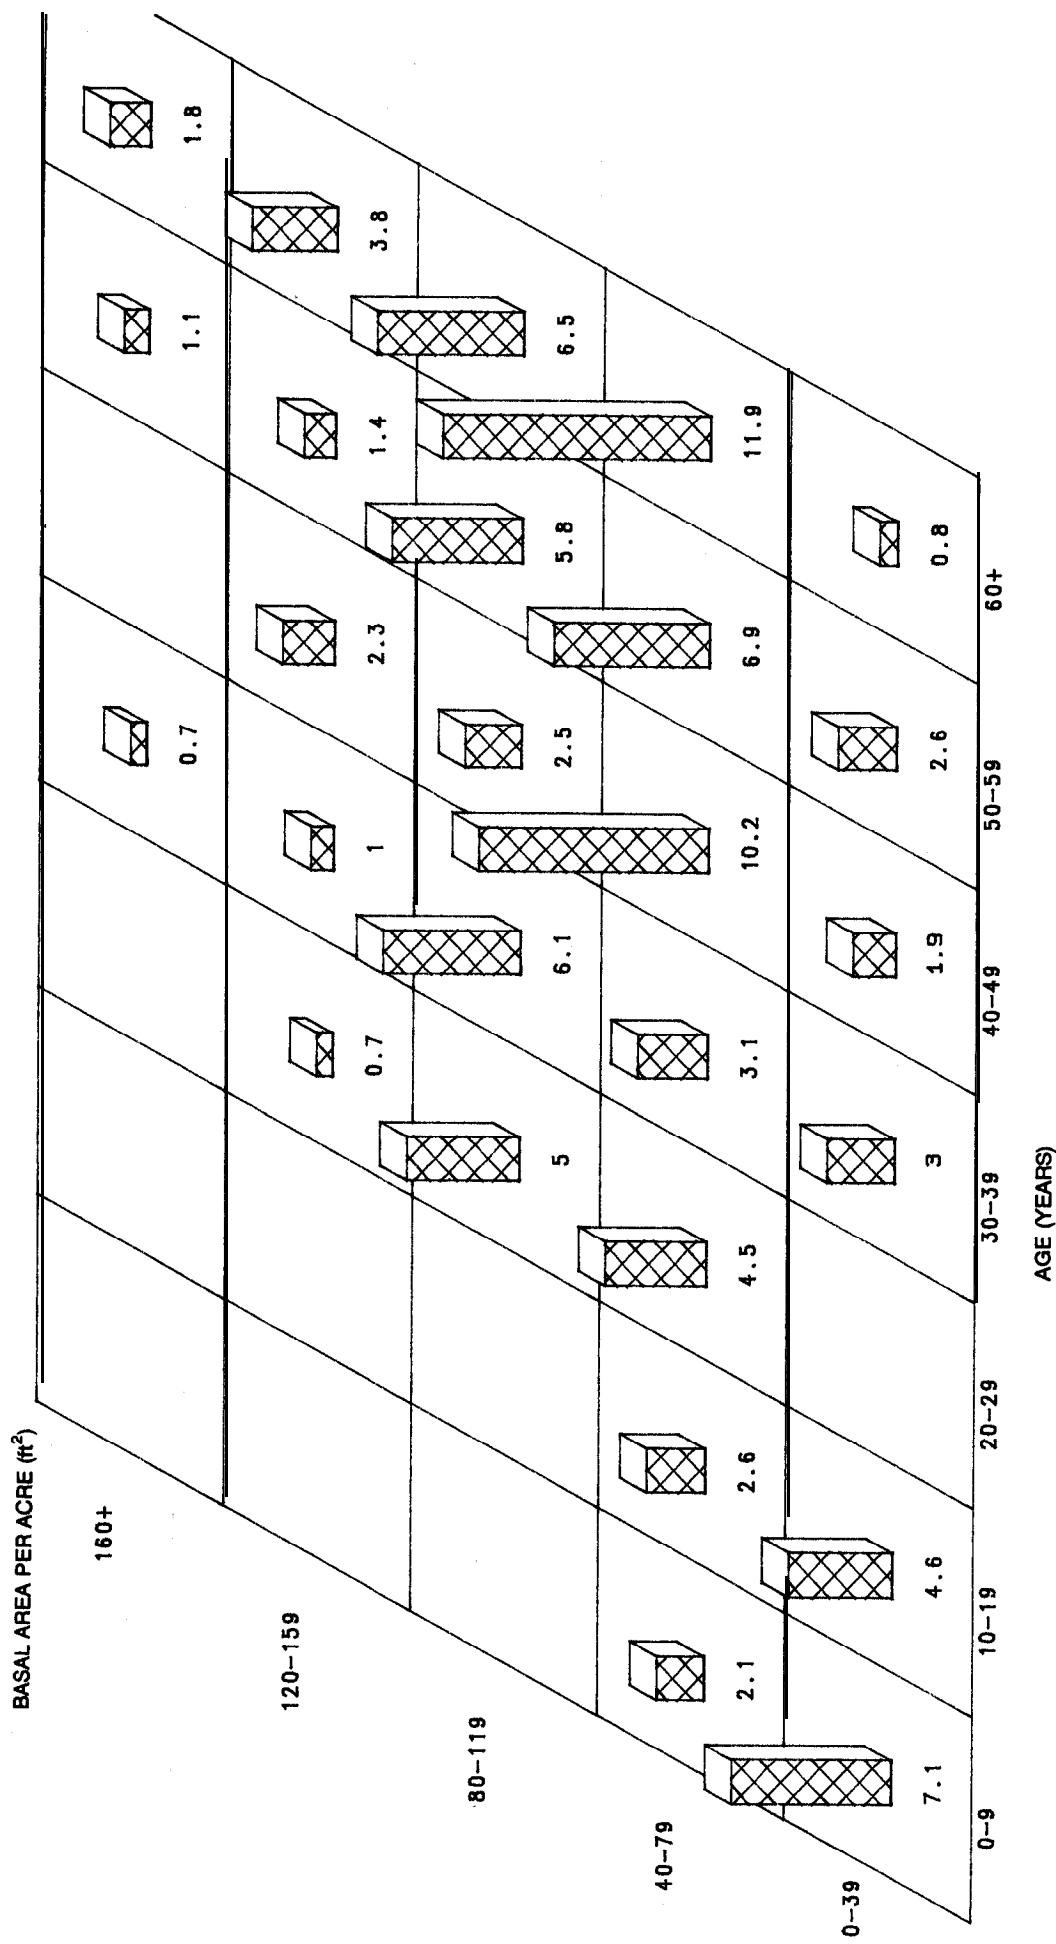

Figure 58B.—Percentage distribution of longleaf pine stands in South Carolina, by basal area per acre and stand age. (Represents 345,145 acres of natural stands, and 51,326 acres of planted stands.)

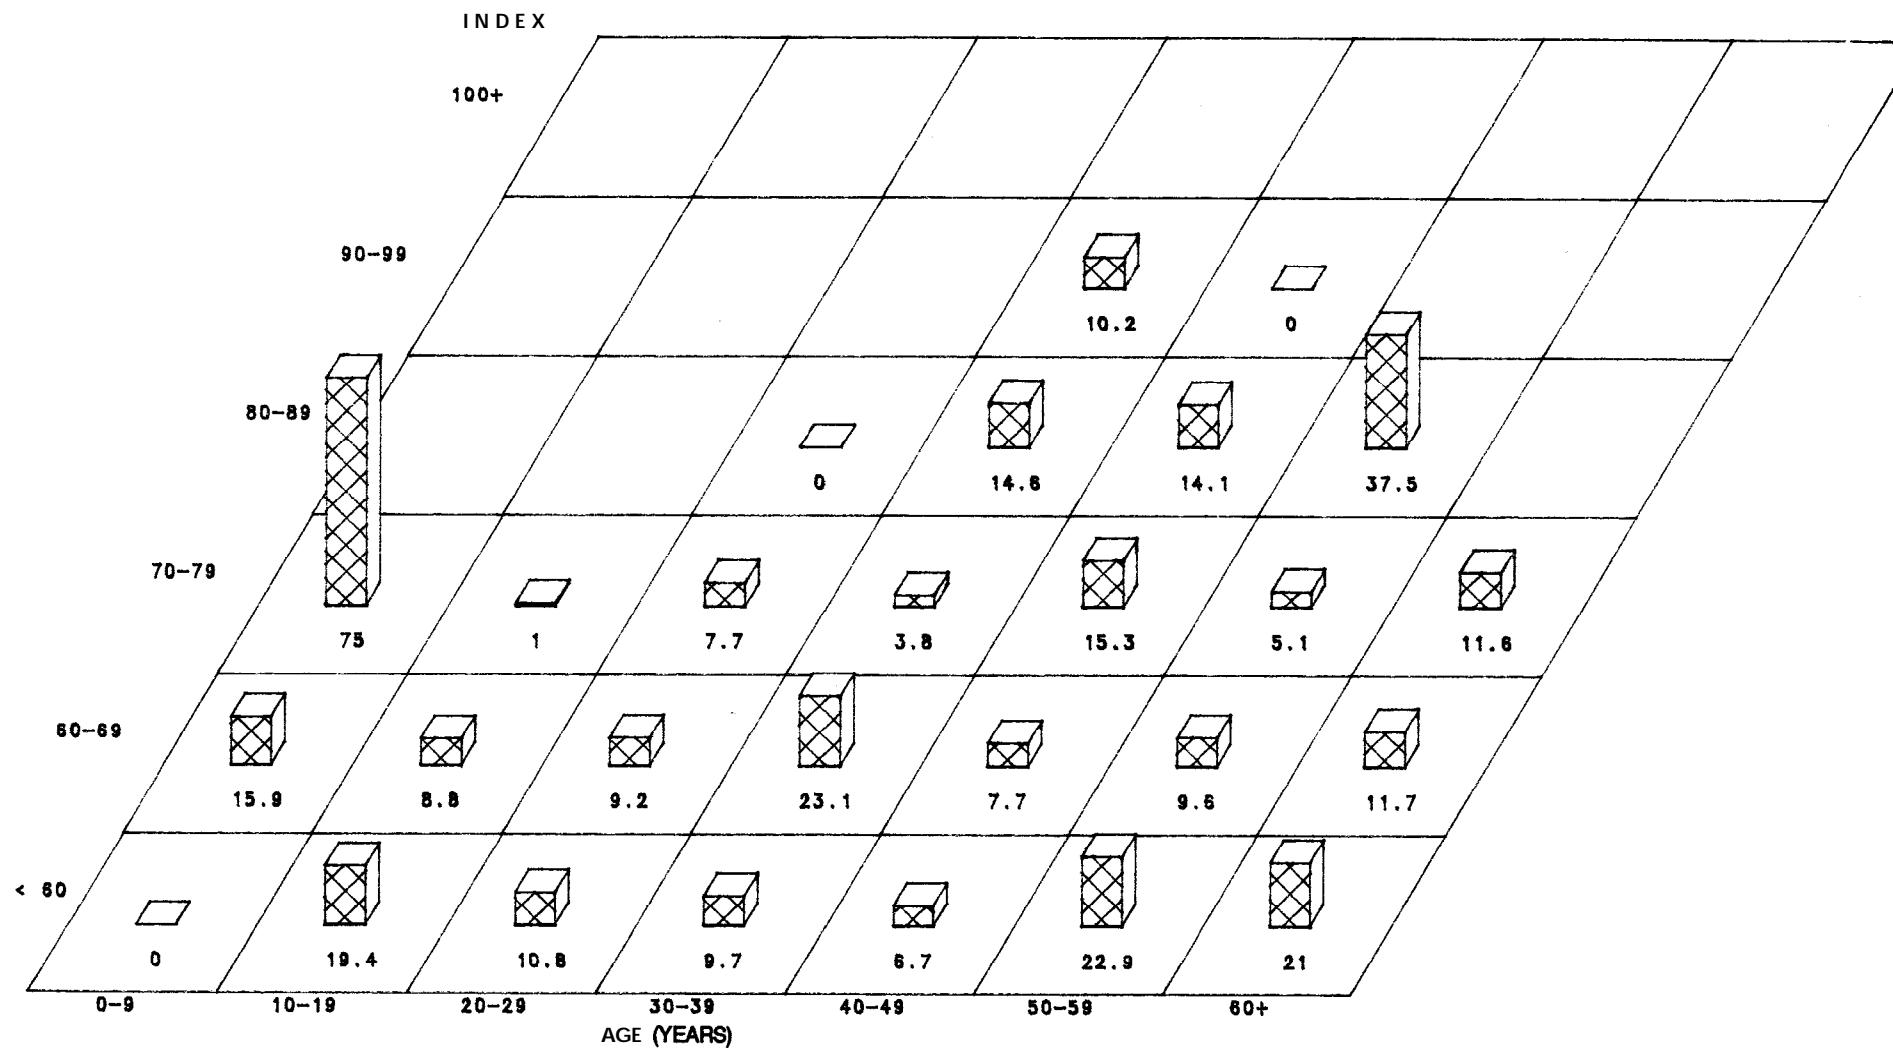

Figure 58C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for longleaf pine stands in South Carolina
 (Represents 345,145 acres of natural stands, and 51,326 acres of planted stands.)

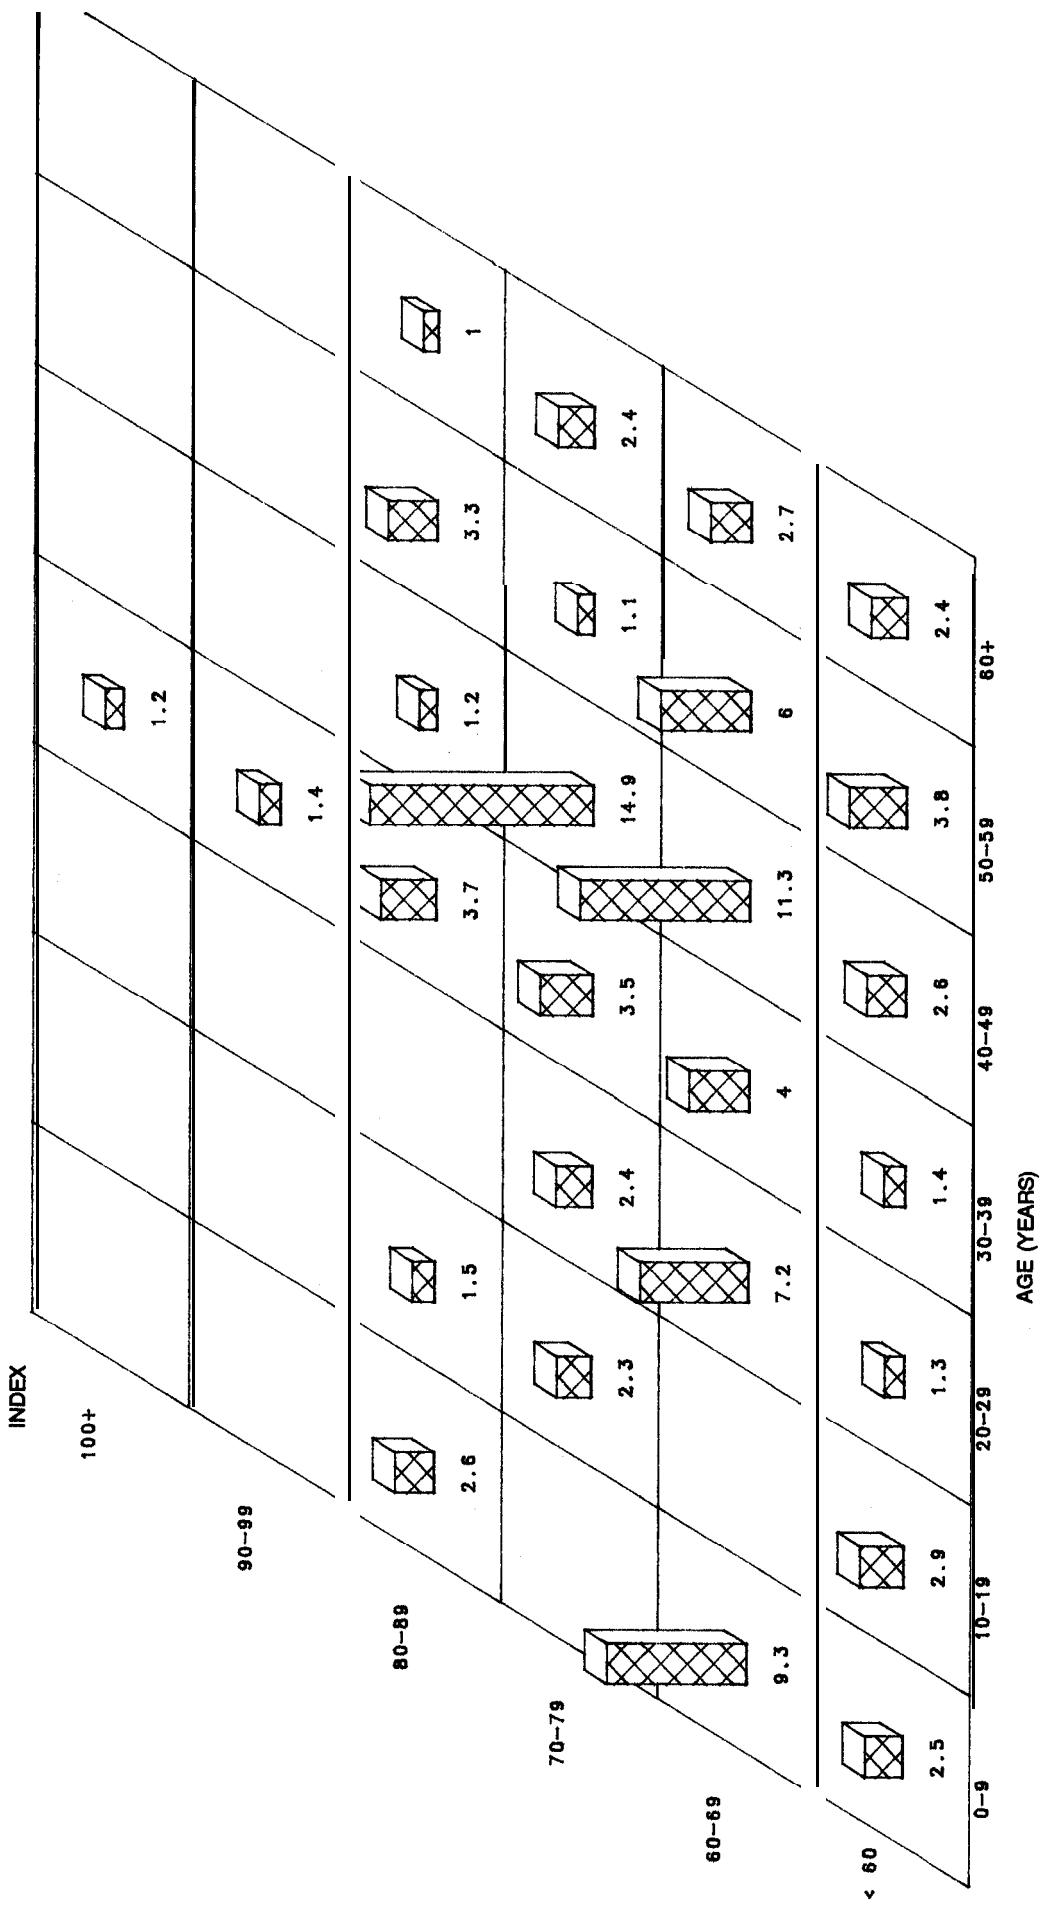

Figure 59A.—Percentage distribution of pond pine stands in South Carolina, by site index and stand age. (Represents 196,335 acres of natural stands, and 4,815 acres of planted stands.)

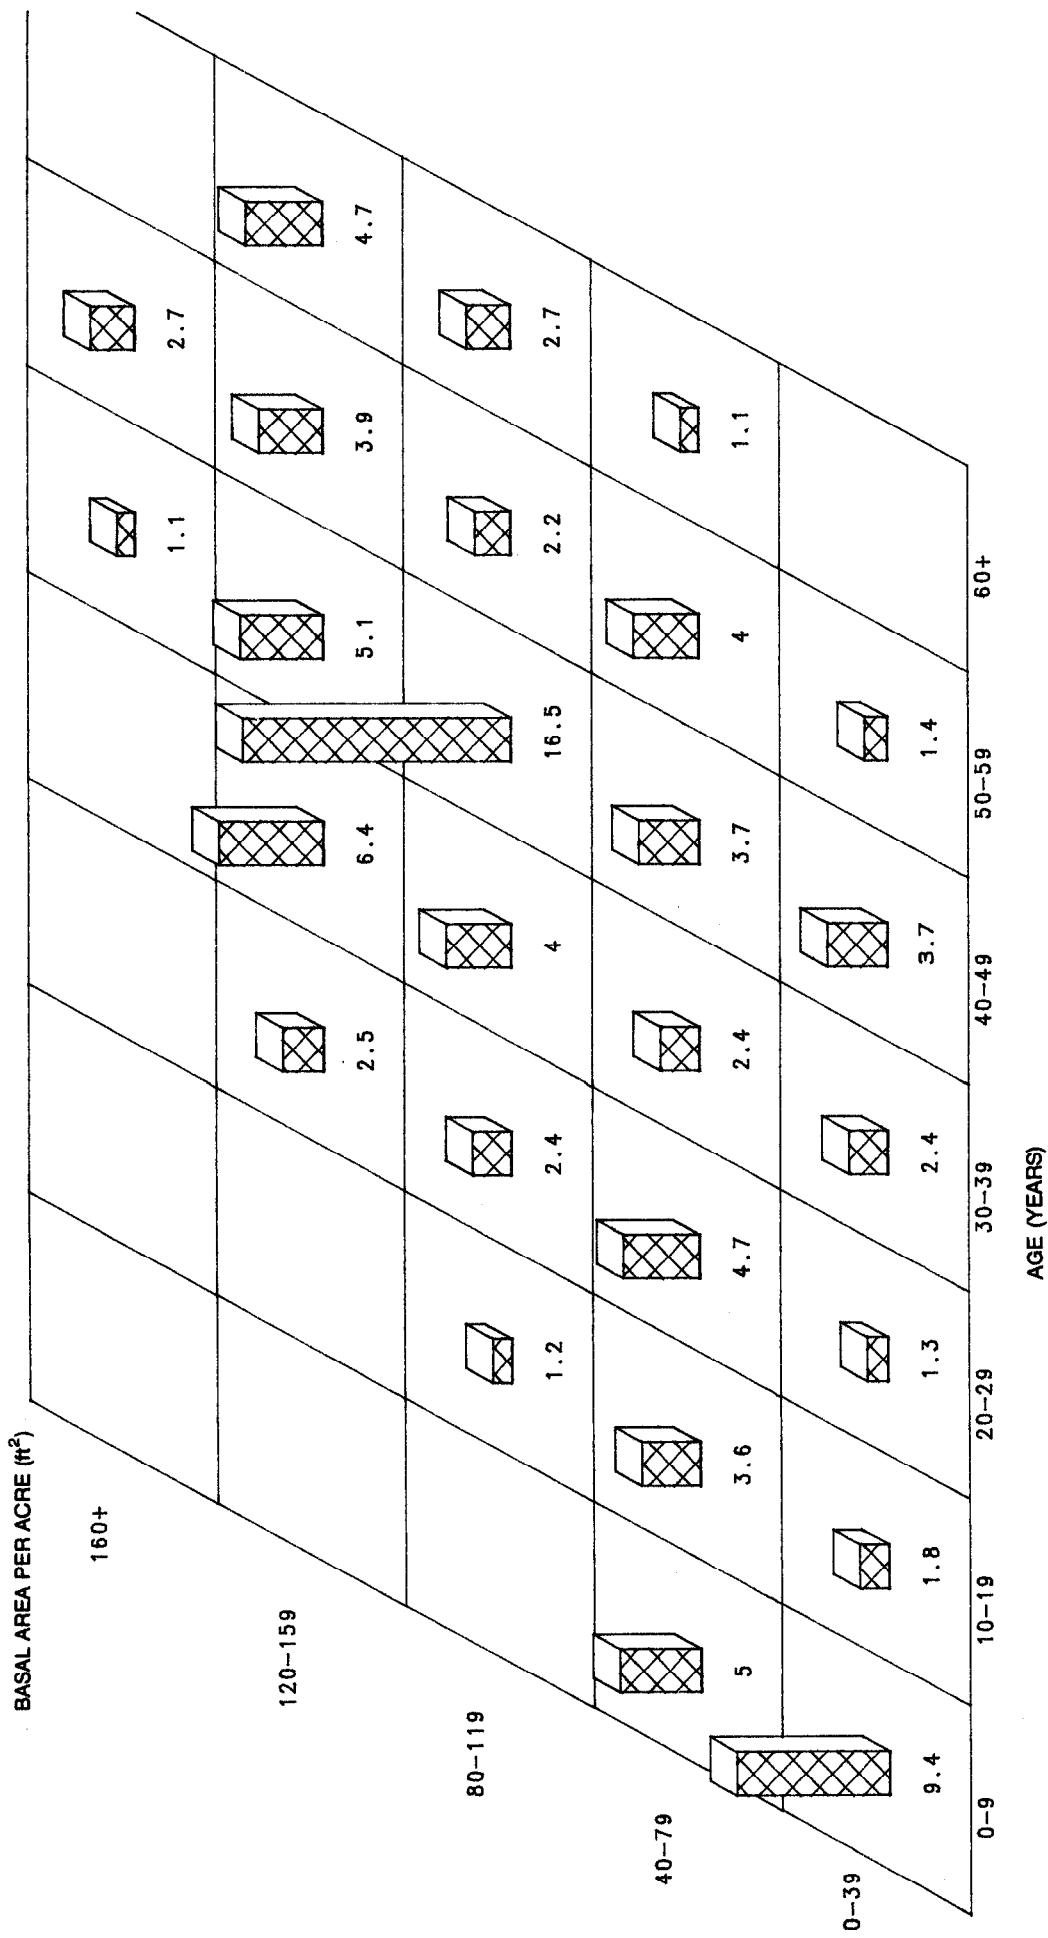

Figure 59B.—Percentage distribution of pond pine stands in South Carolina, by basal area and stand age. (Represents 196,335 acres of natural stands, and 4,815 acres of planted stands.)

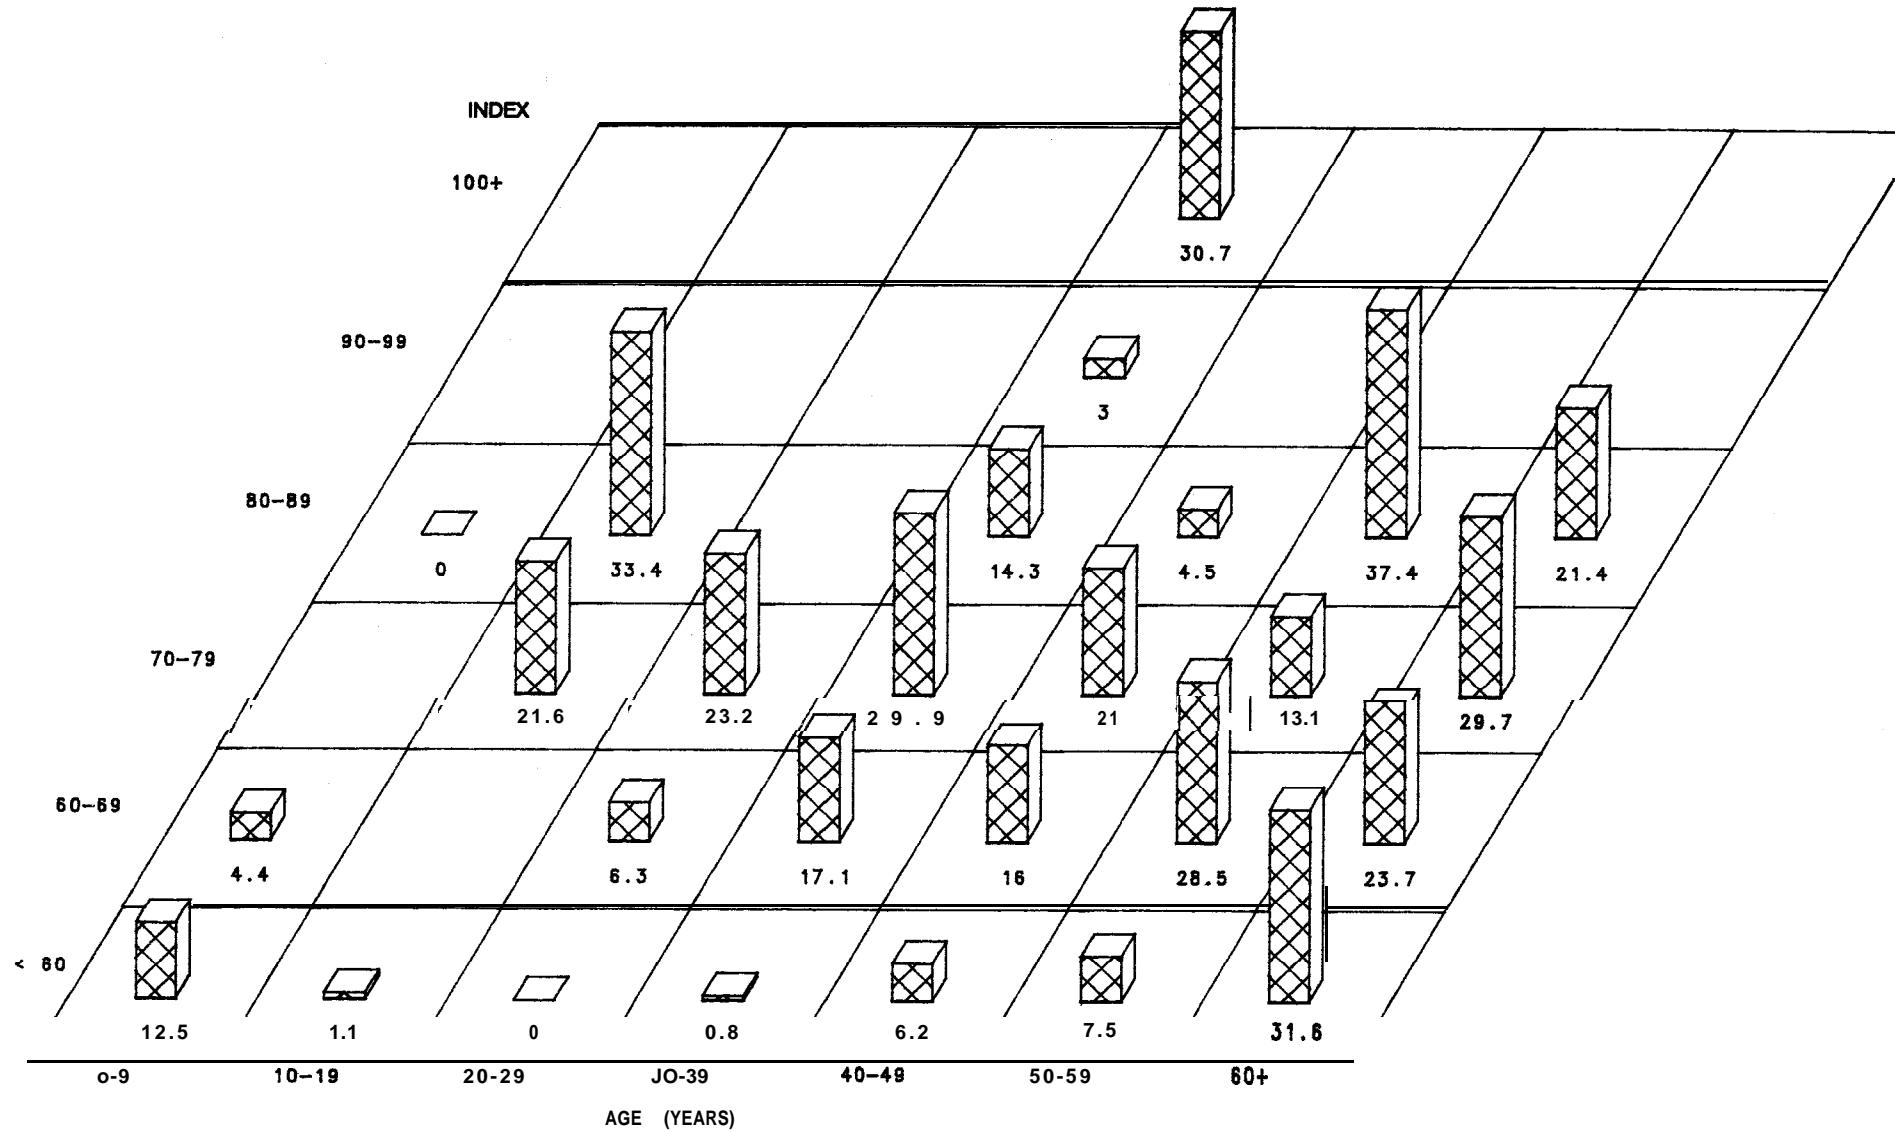

Figure 59C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for pond pine stands in South Carolina.
 (Represents 196,335 acres of natural stands, and 4,815 acres of planted stands.)

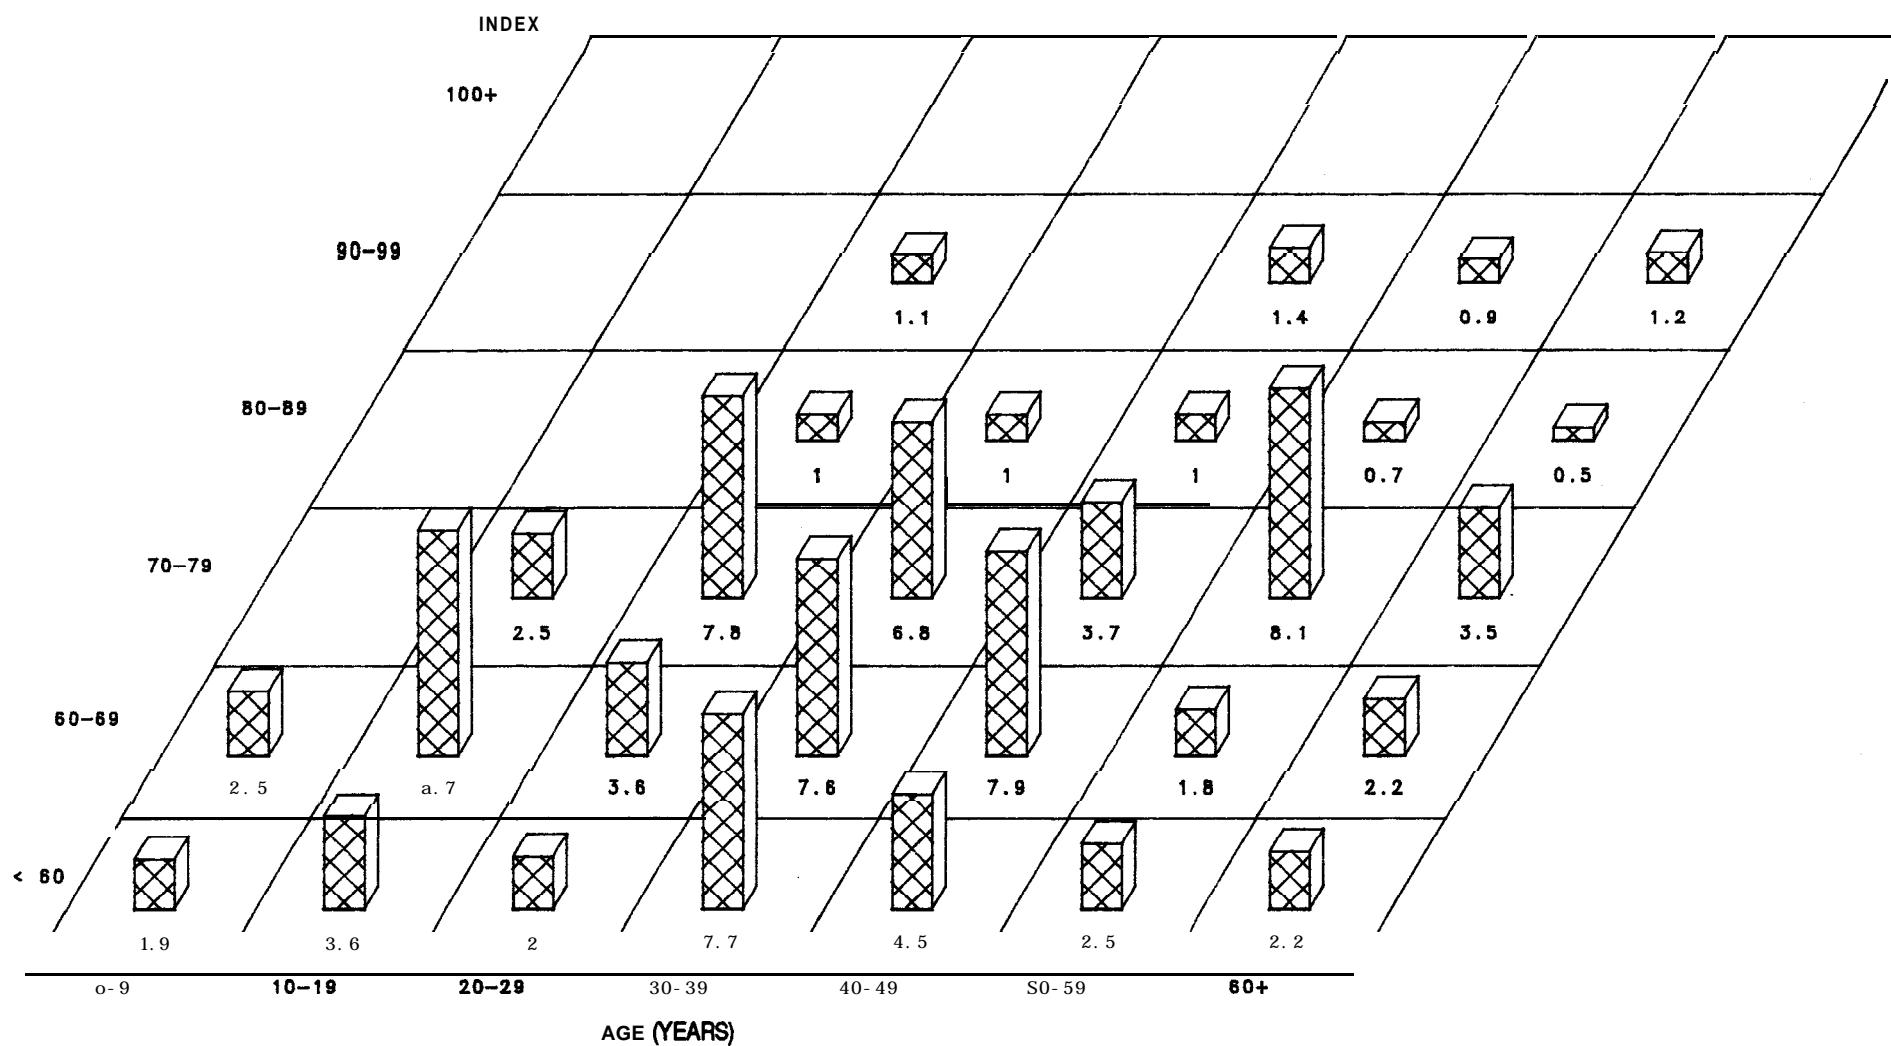

Figure 60A.—Percentage distribution of **shortleaf** pine stands in **South** Carolina, by site index and stand age. (Represents 361,193 acres of natural stands, and 6,044 acres of planted stands.)

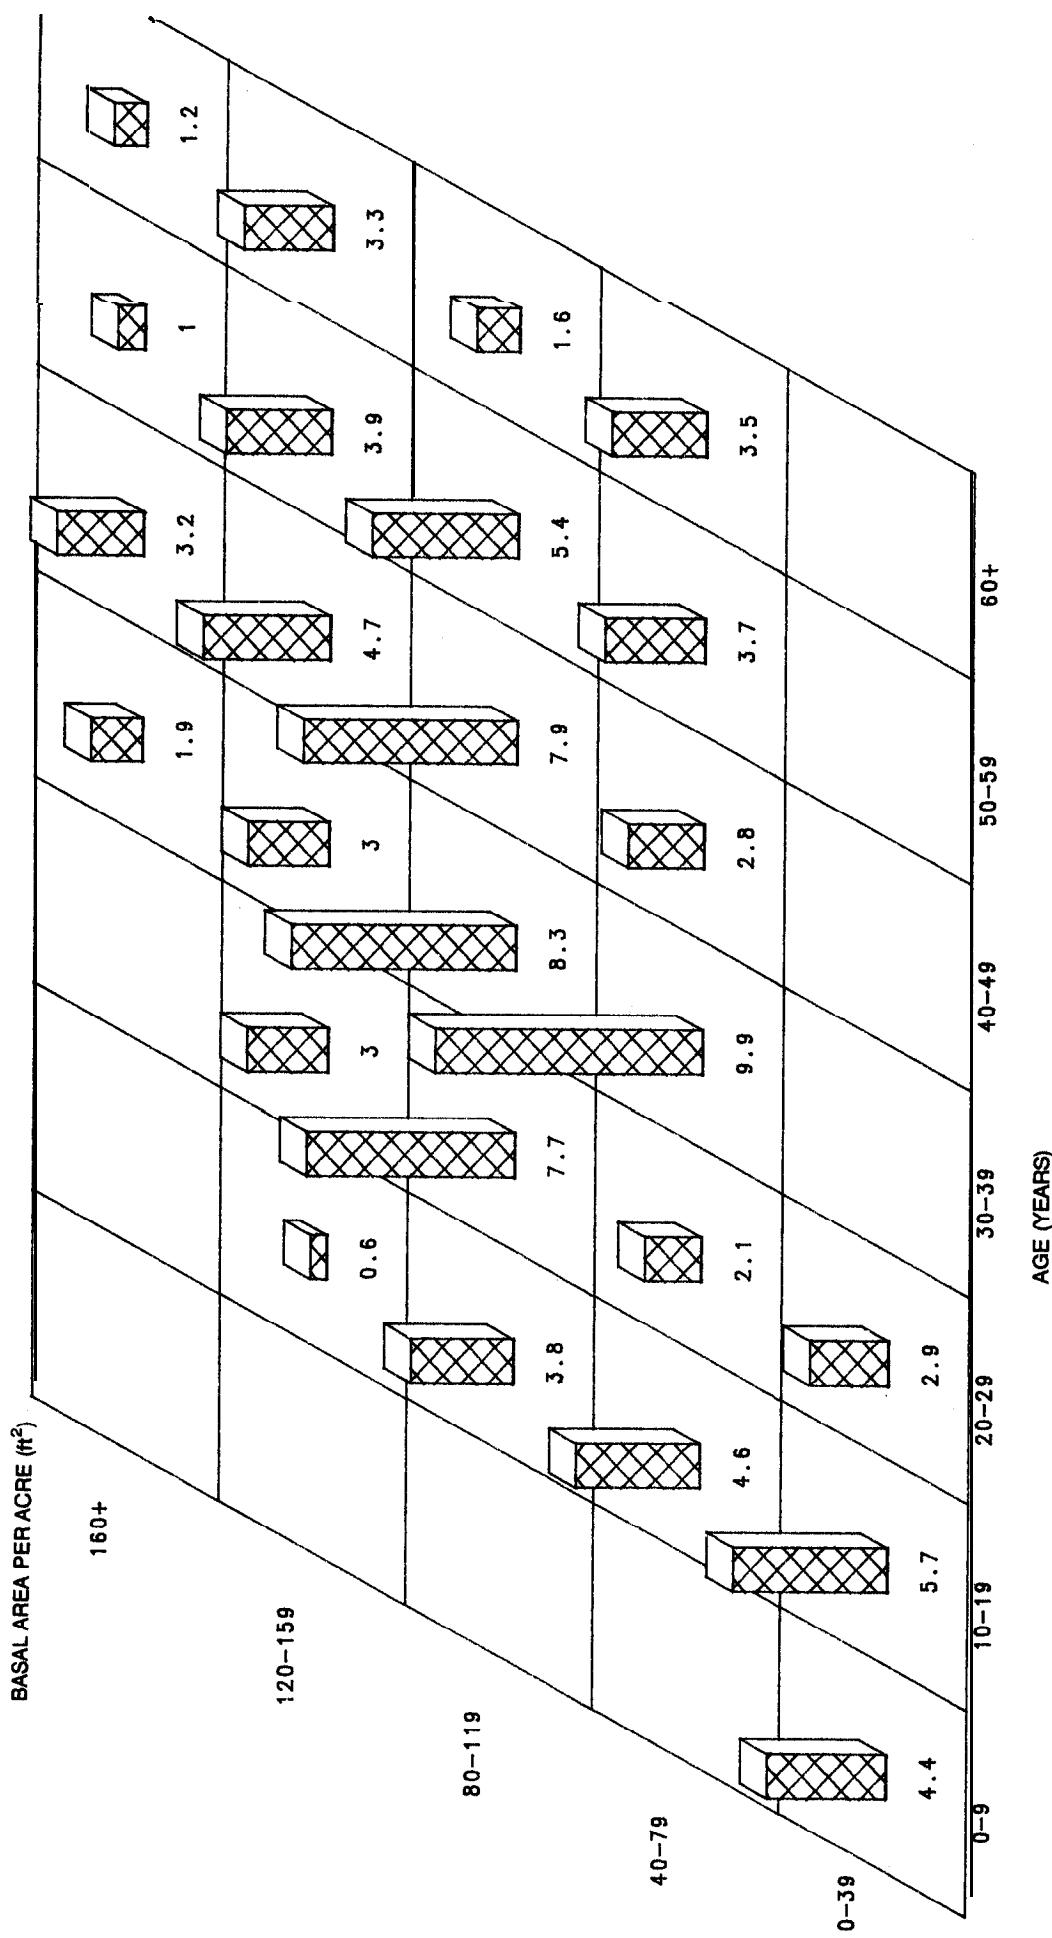

Figure 60B.—Percentage distribution of shortleaf pine stands in South Carolina, by basal area per acre and stand age. (Represents 361,193 acres of natural stands, and 6,044 acres of planted stands.)

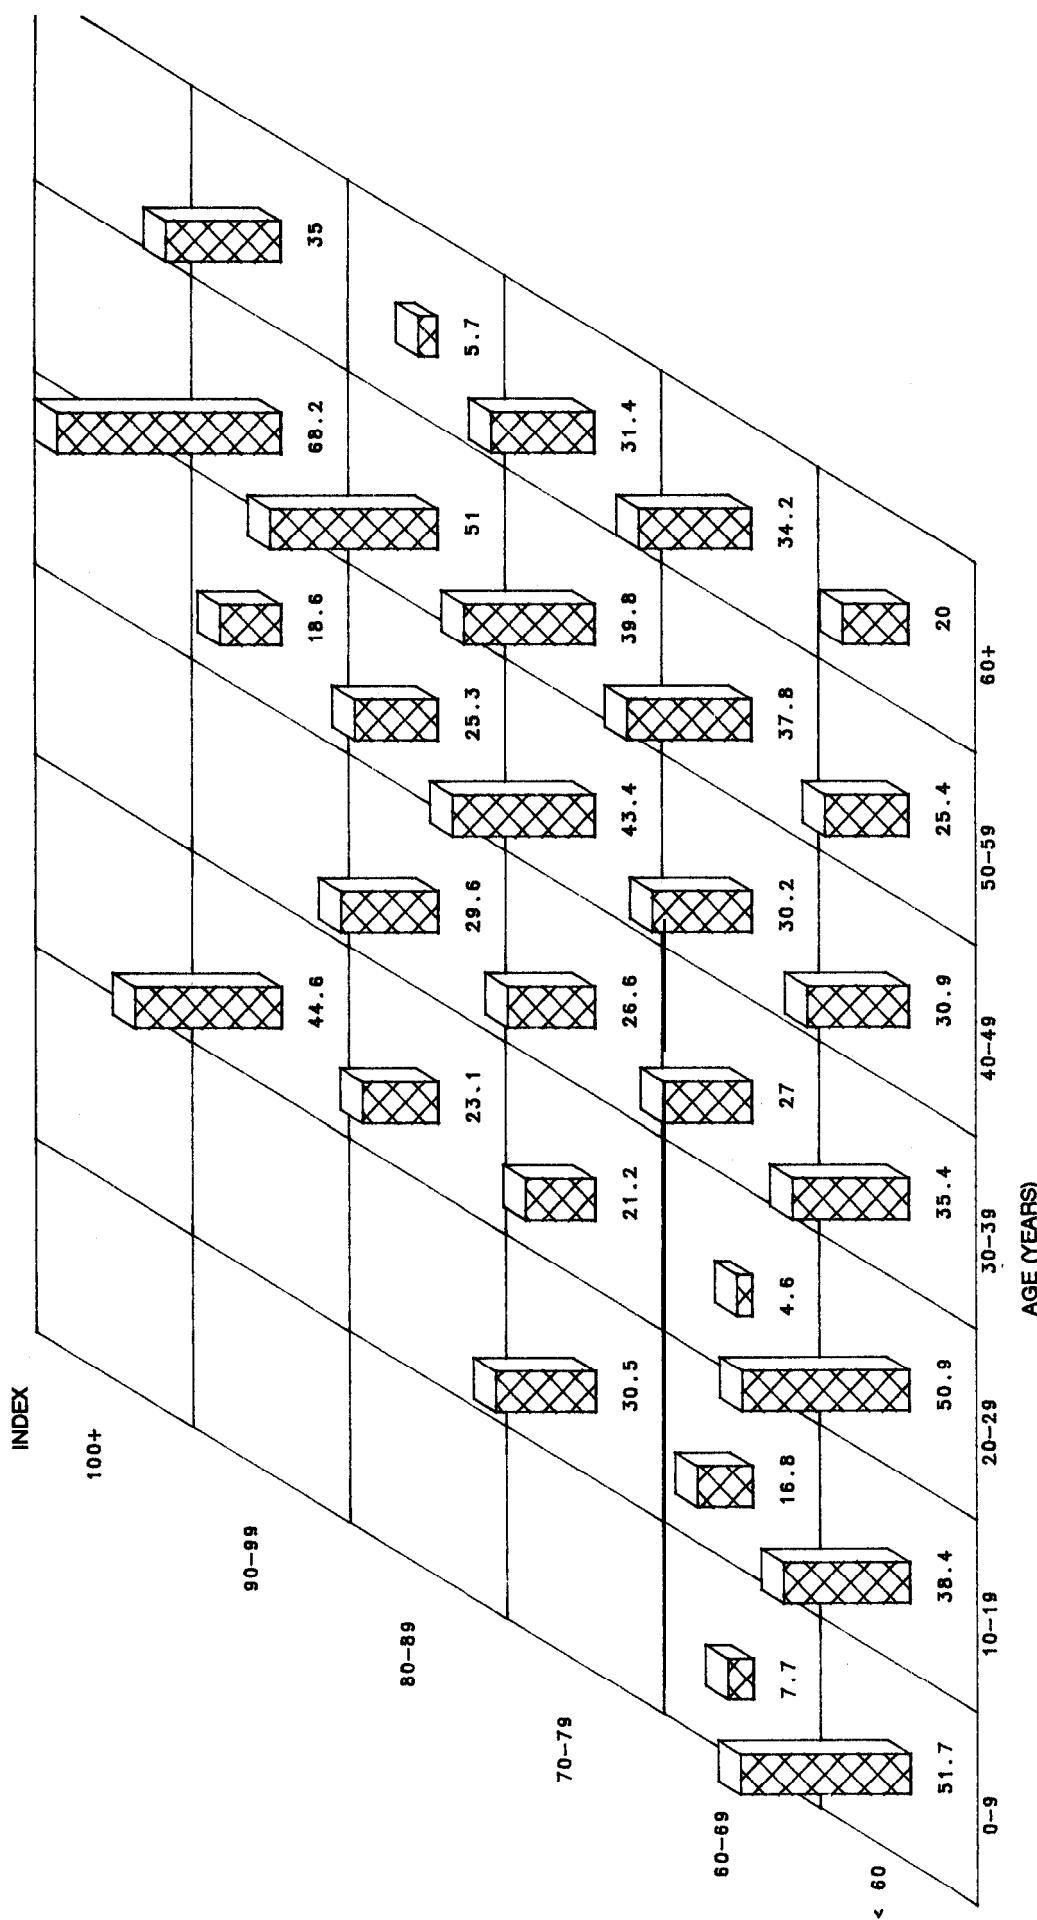

Figure 60C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for shortleaf pine stands in South Carolina.
(Represents 361,183 acres of natural stands, and 6,044 acres of planted stands.)

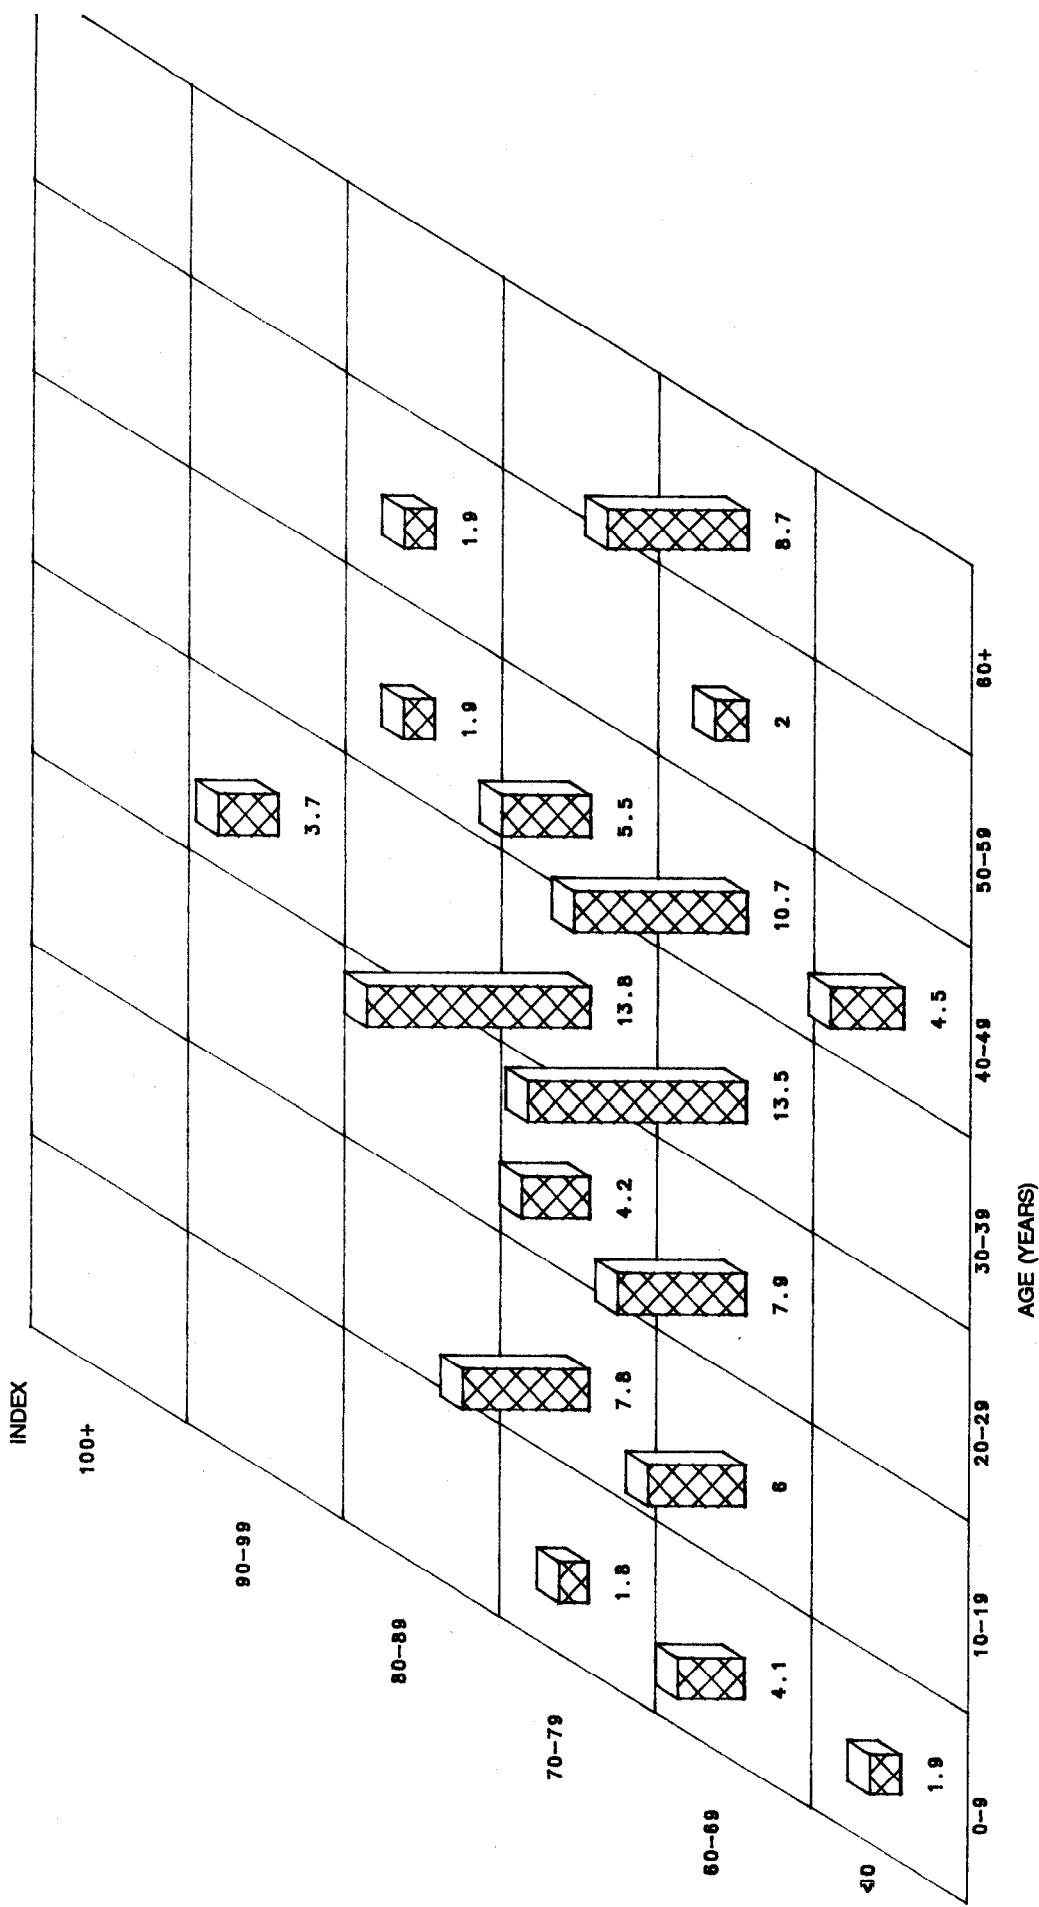

Figure 61A—Percentage distribution of Virginia pine stands in South Carolina, by site index and stand age. (Represents 187,143 acres of natural stands, and 4,116 acres of planted stands.)

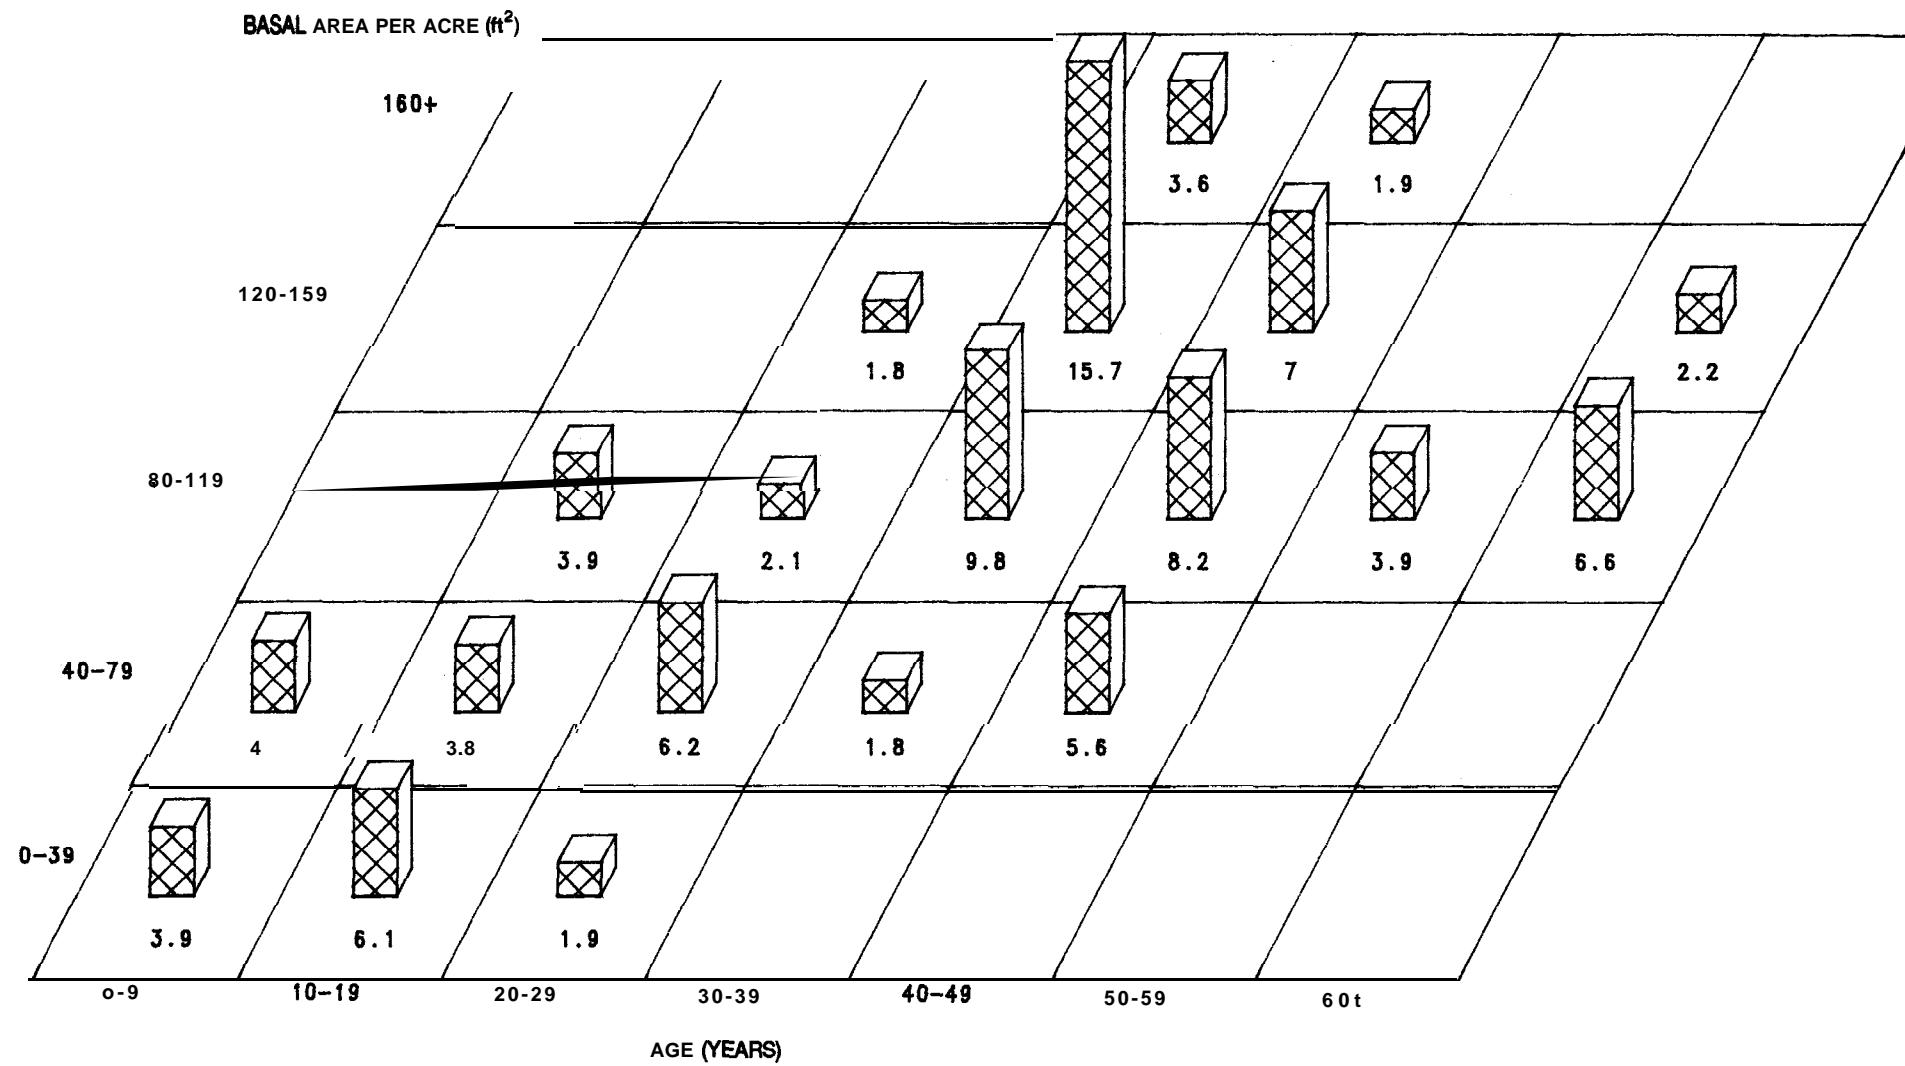

Figure 61 B.-Percentage distribution of Virginia pine stands in South Carolina, by basal area per acre and stand age. (Represents 187,143 acres of natural stands, and 4,116 acres of planted stands.)

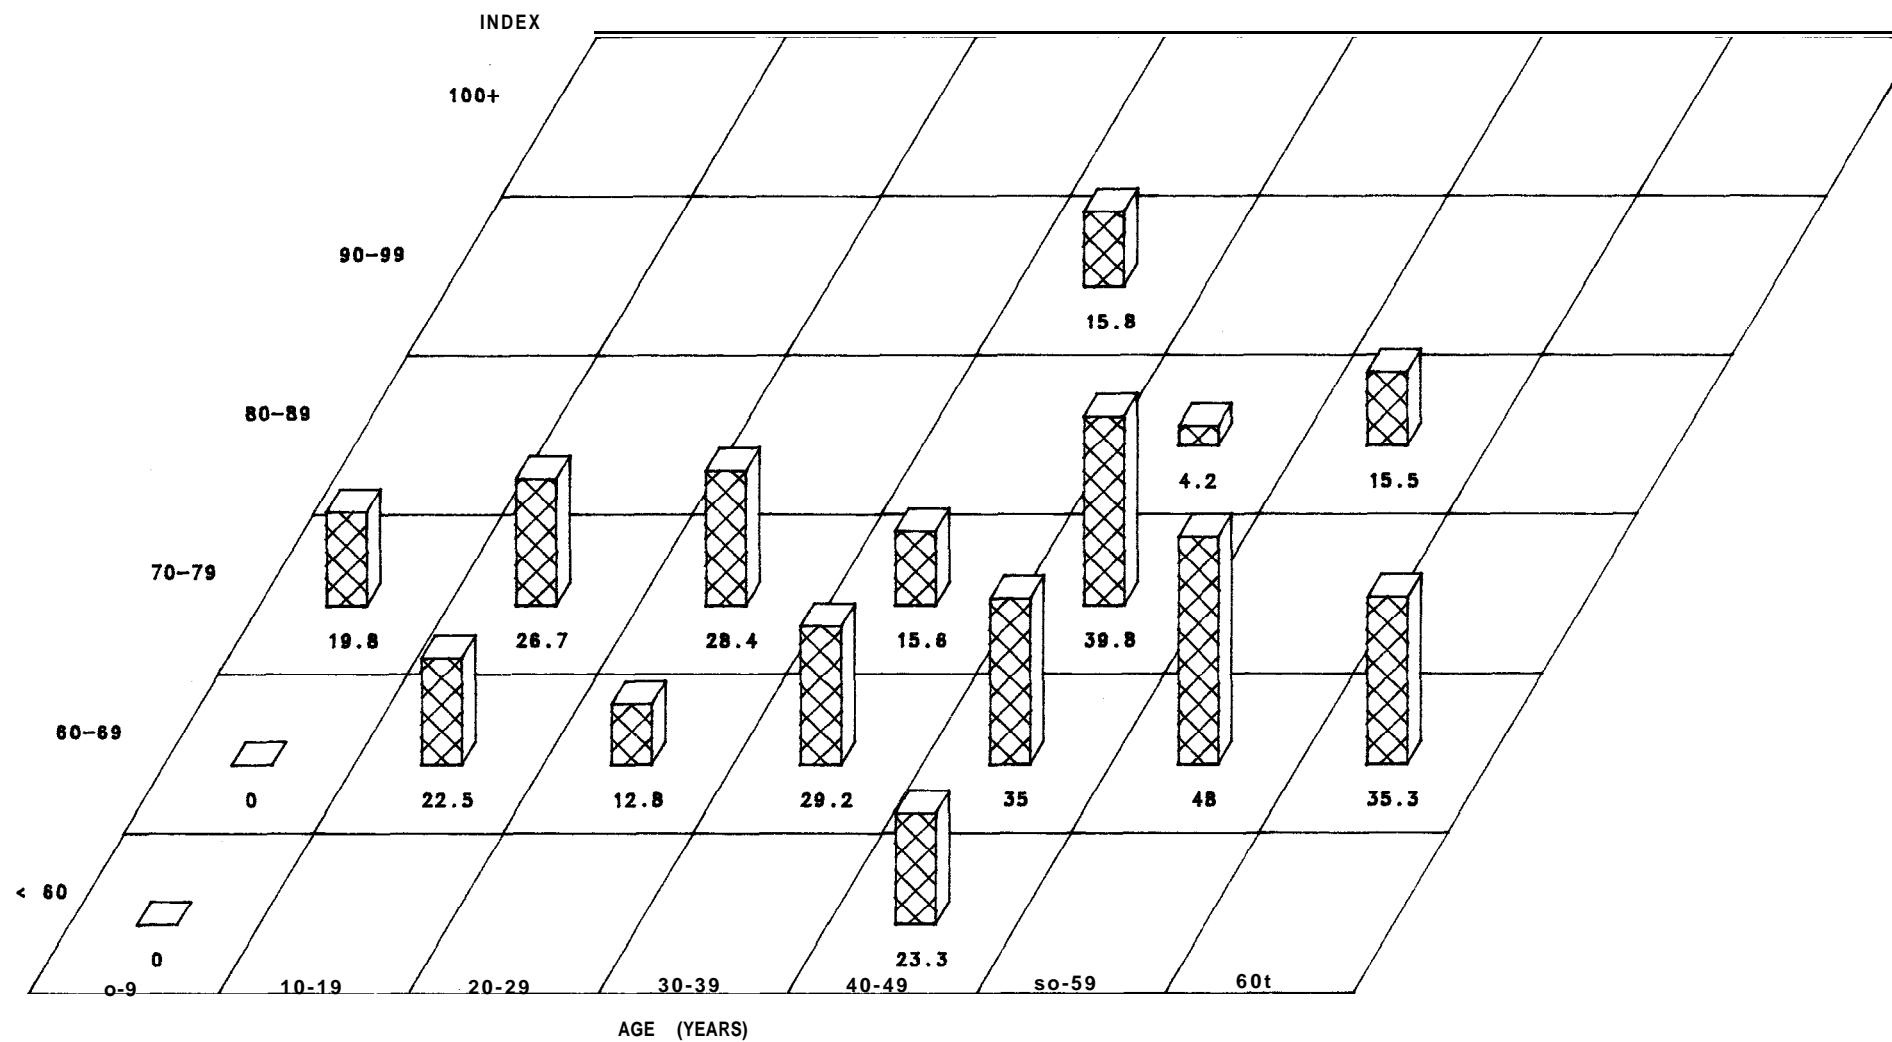

Figure 61C.-Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for Virginia pine stands in South Carolina.
(Represents 167,143 acres of natural stands, and 4,116 acres of planted stands.)

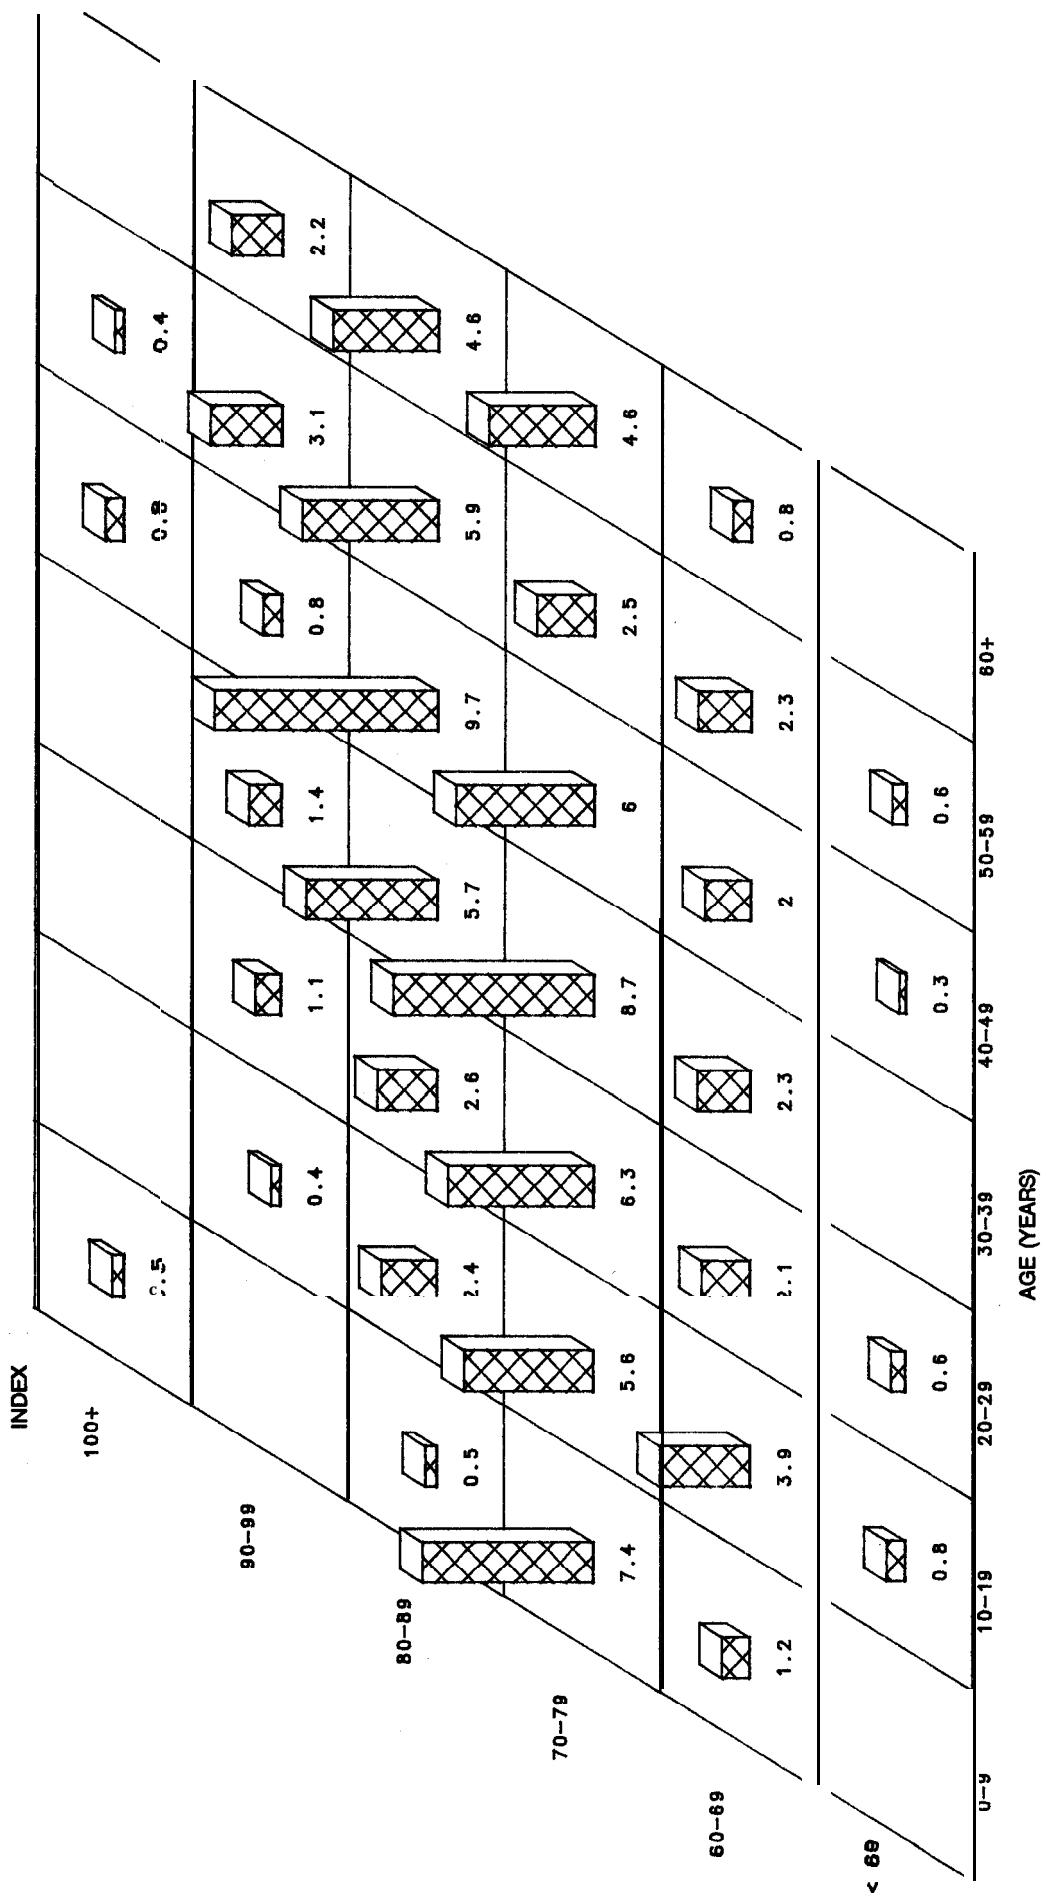

Figure 62A.—Percentage distribution of natural loblolly pine stands in Virginia, by site index and stand age. (Represents 683,082 acres.)

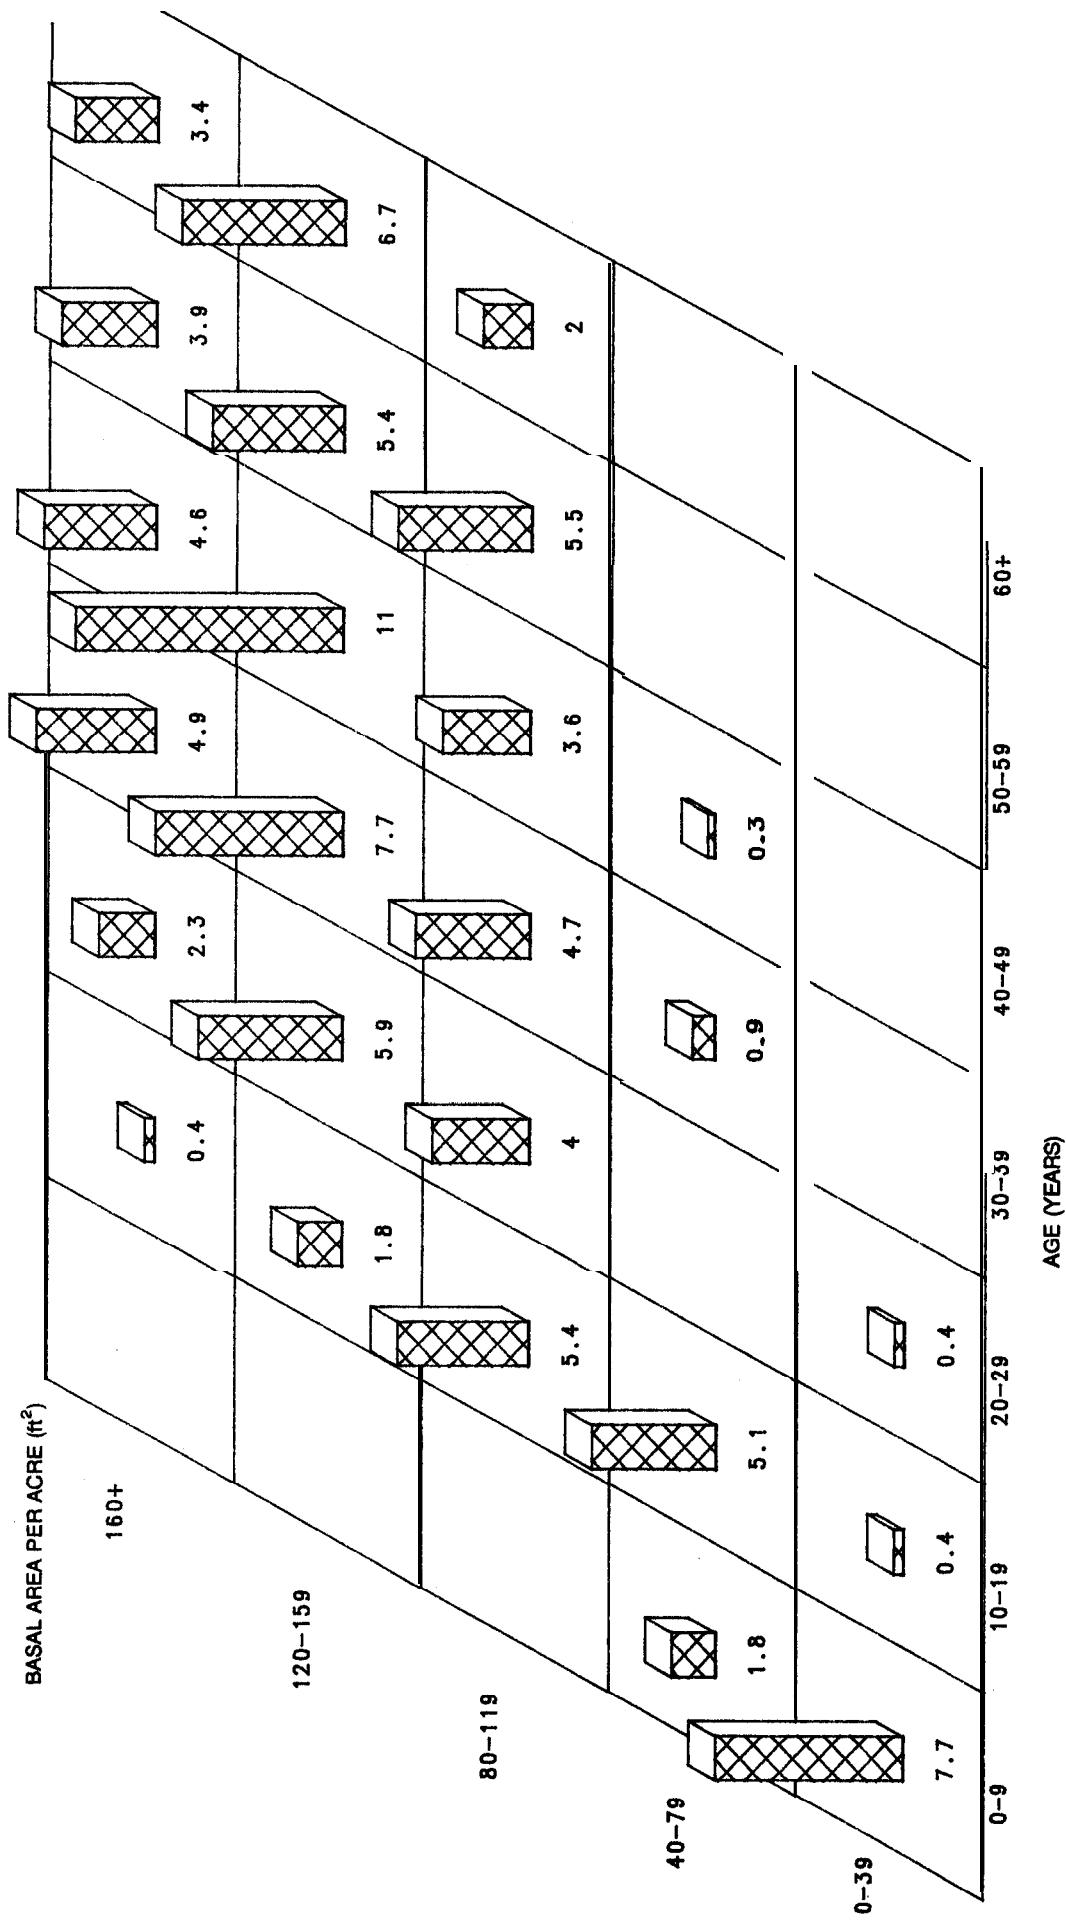

Figure 62B.—Percentage distribution of natural pine stands in Virginia, by basal area per acre and stand age. (Represents 683,082 acres.)

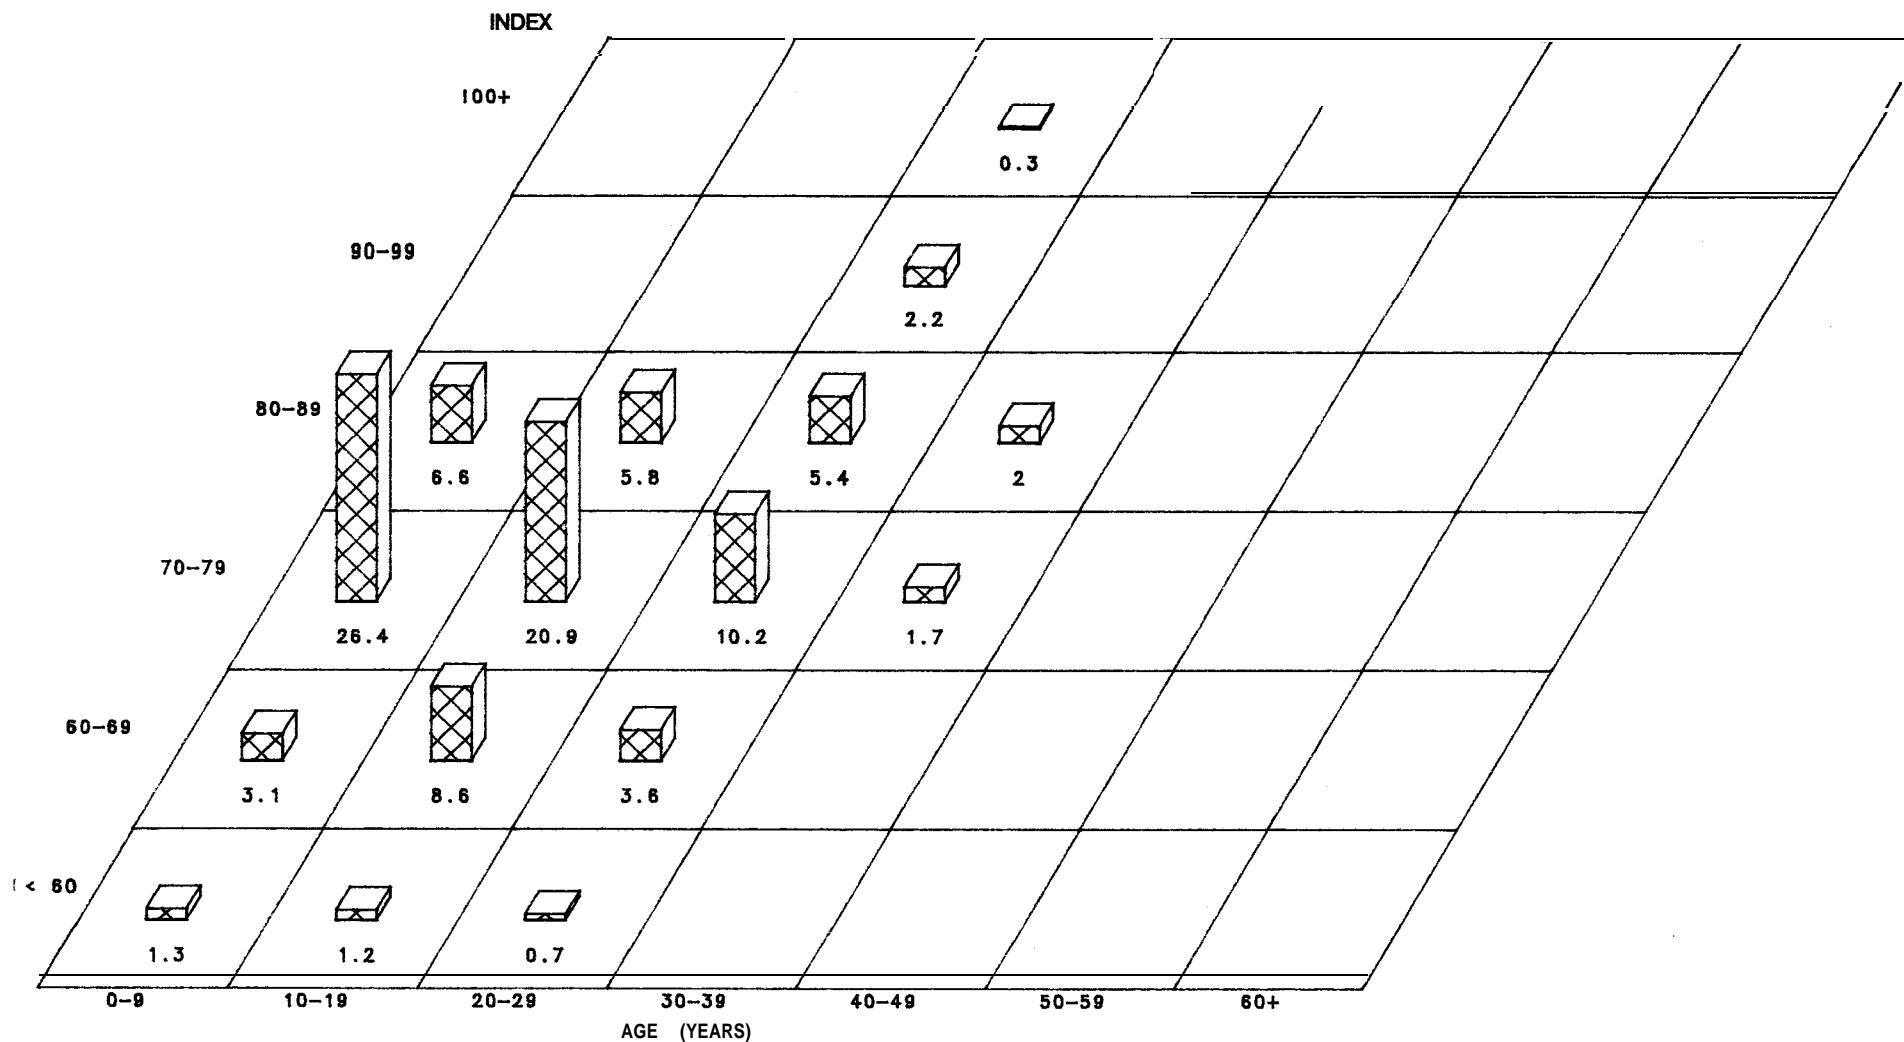

Figure 62C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for natural loblolly pine stands in Virginia
(Represents 683,082 acres.)

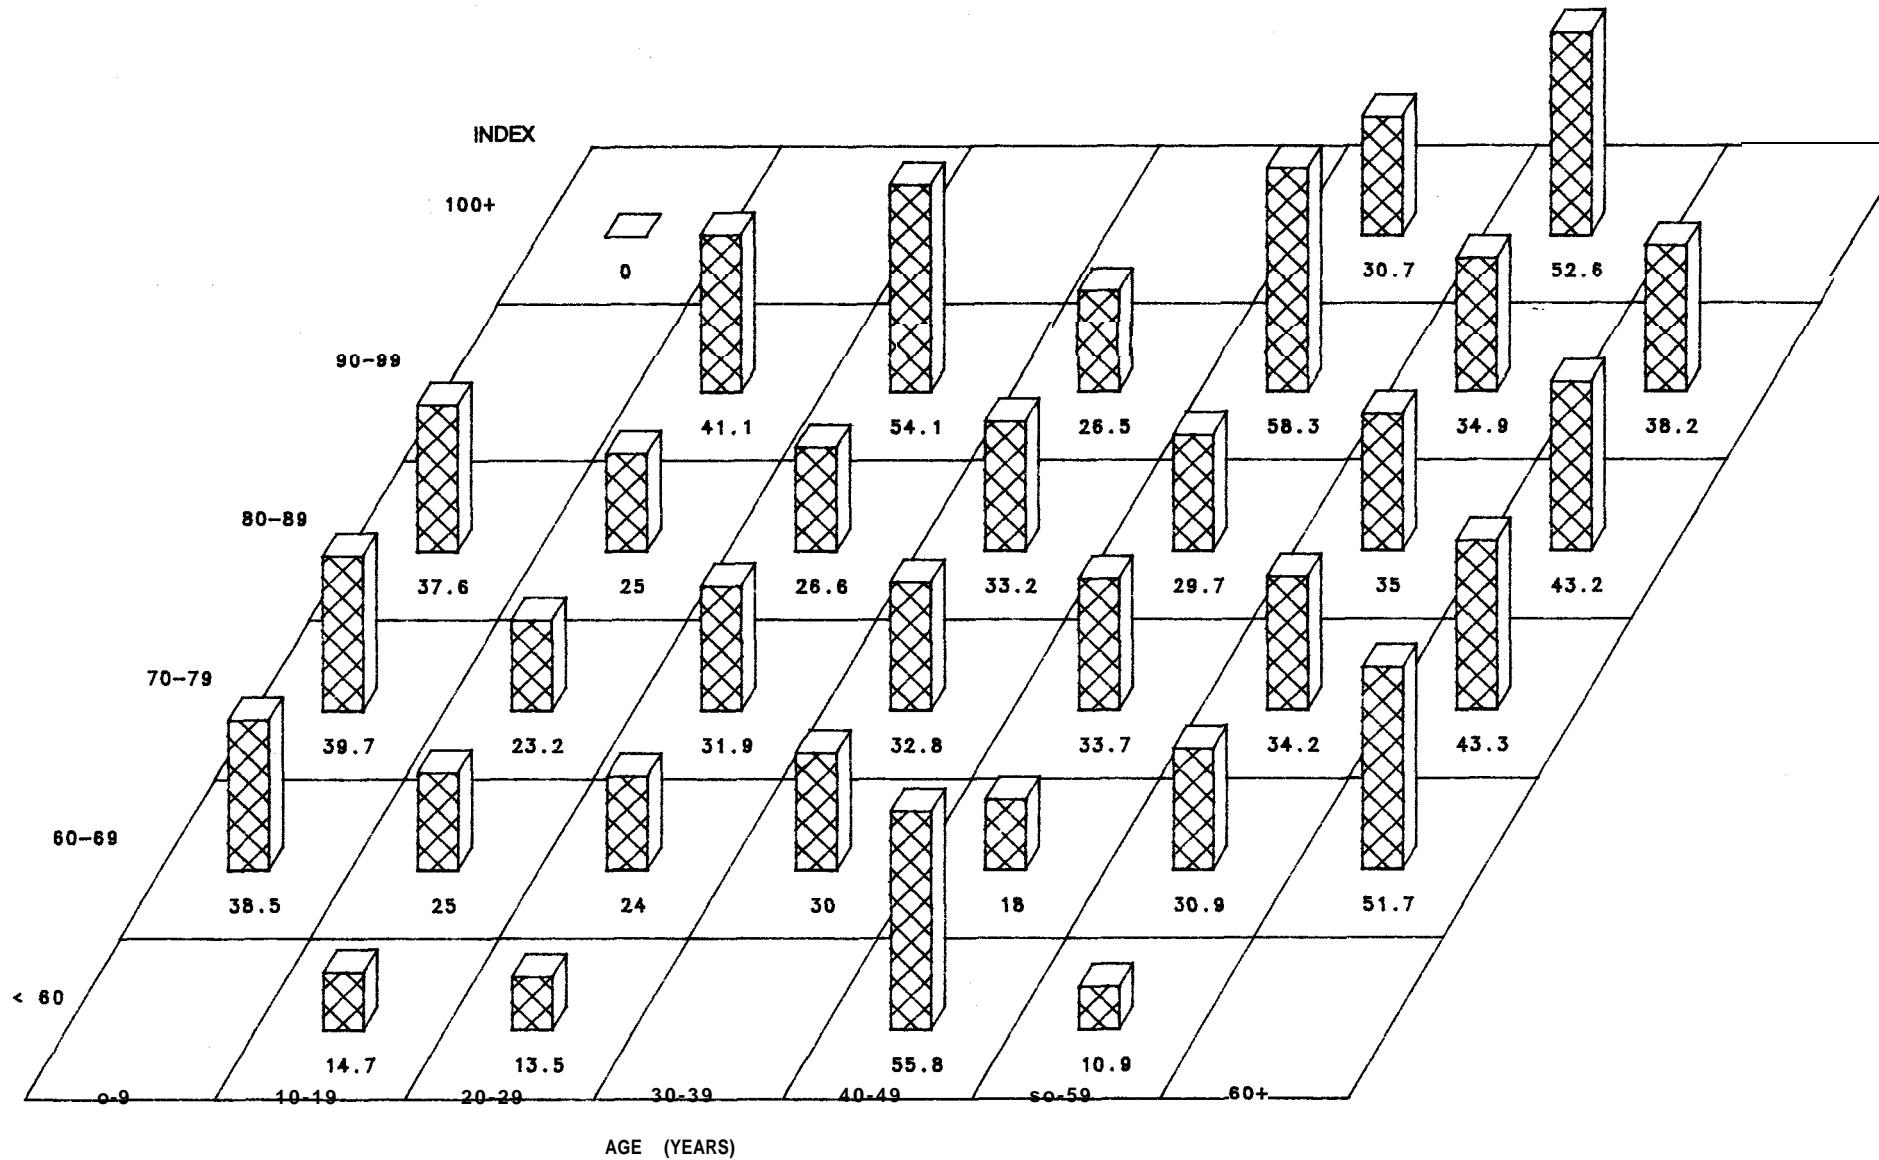

Figure 63A.—Percentage distribution of planted loblolly pine stands in Virginia, by site index and stand age. (Represents 1,089,548 acres.)

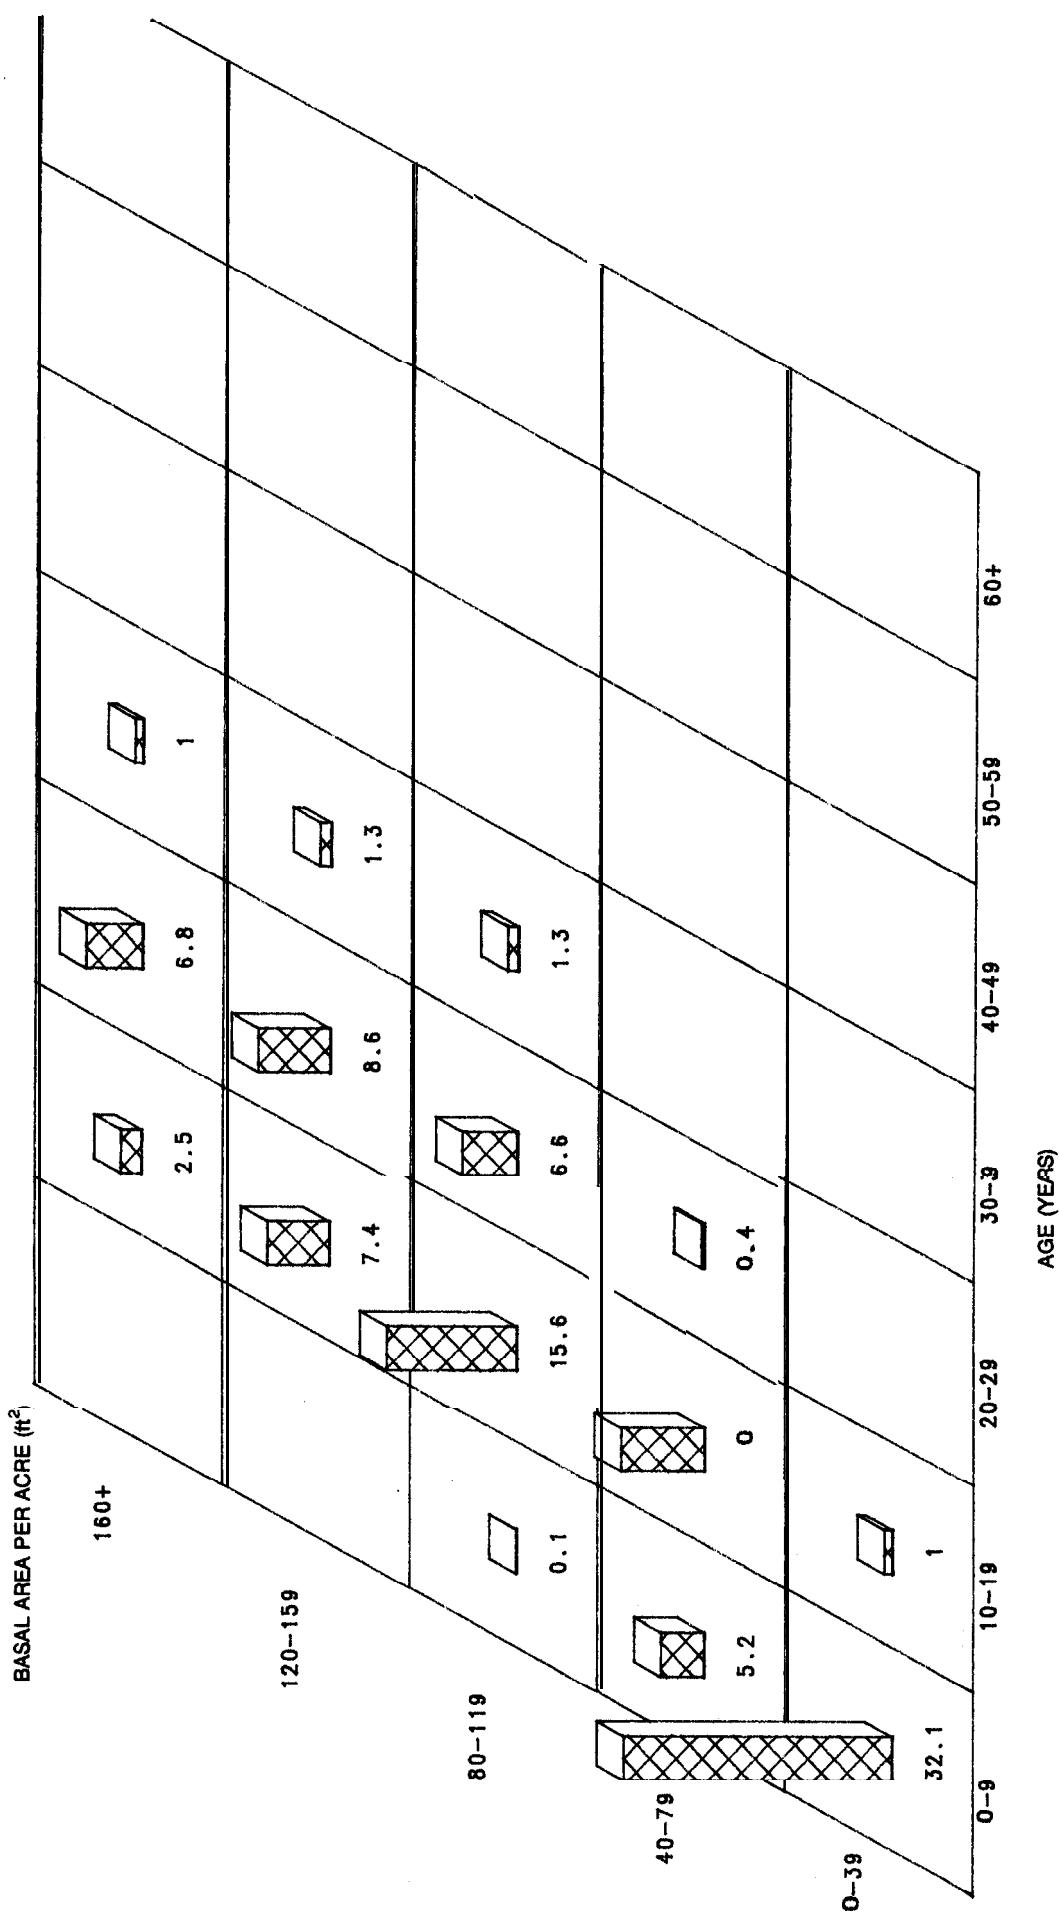

Figure 63B.—Percentage distribution of planted loblolly pine stands in Virginia, by basal area per acre and stand age. (Represents 1,089,548 acres.)

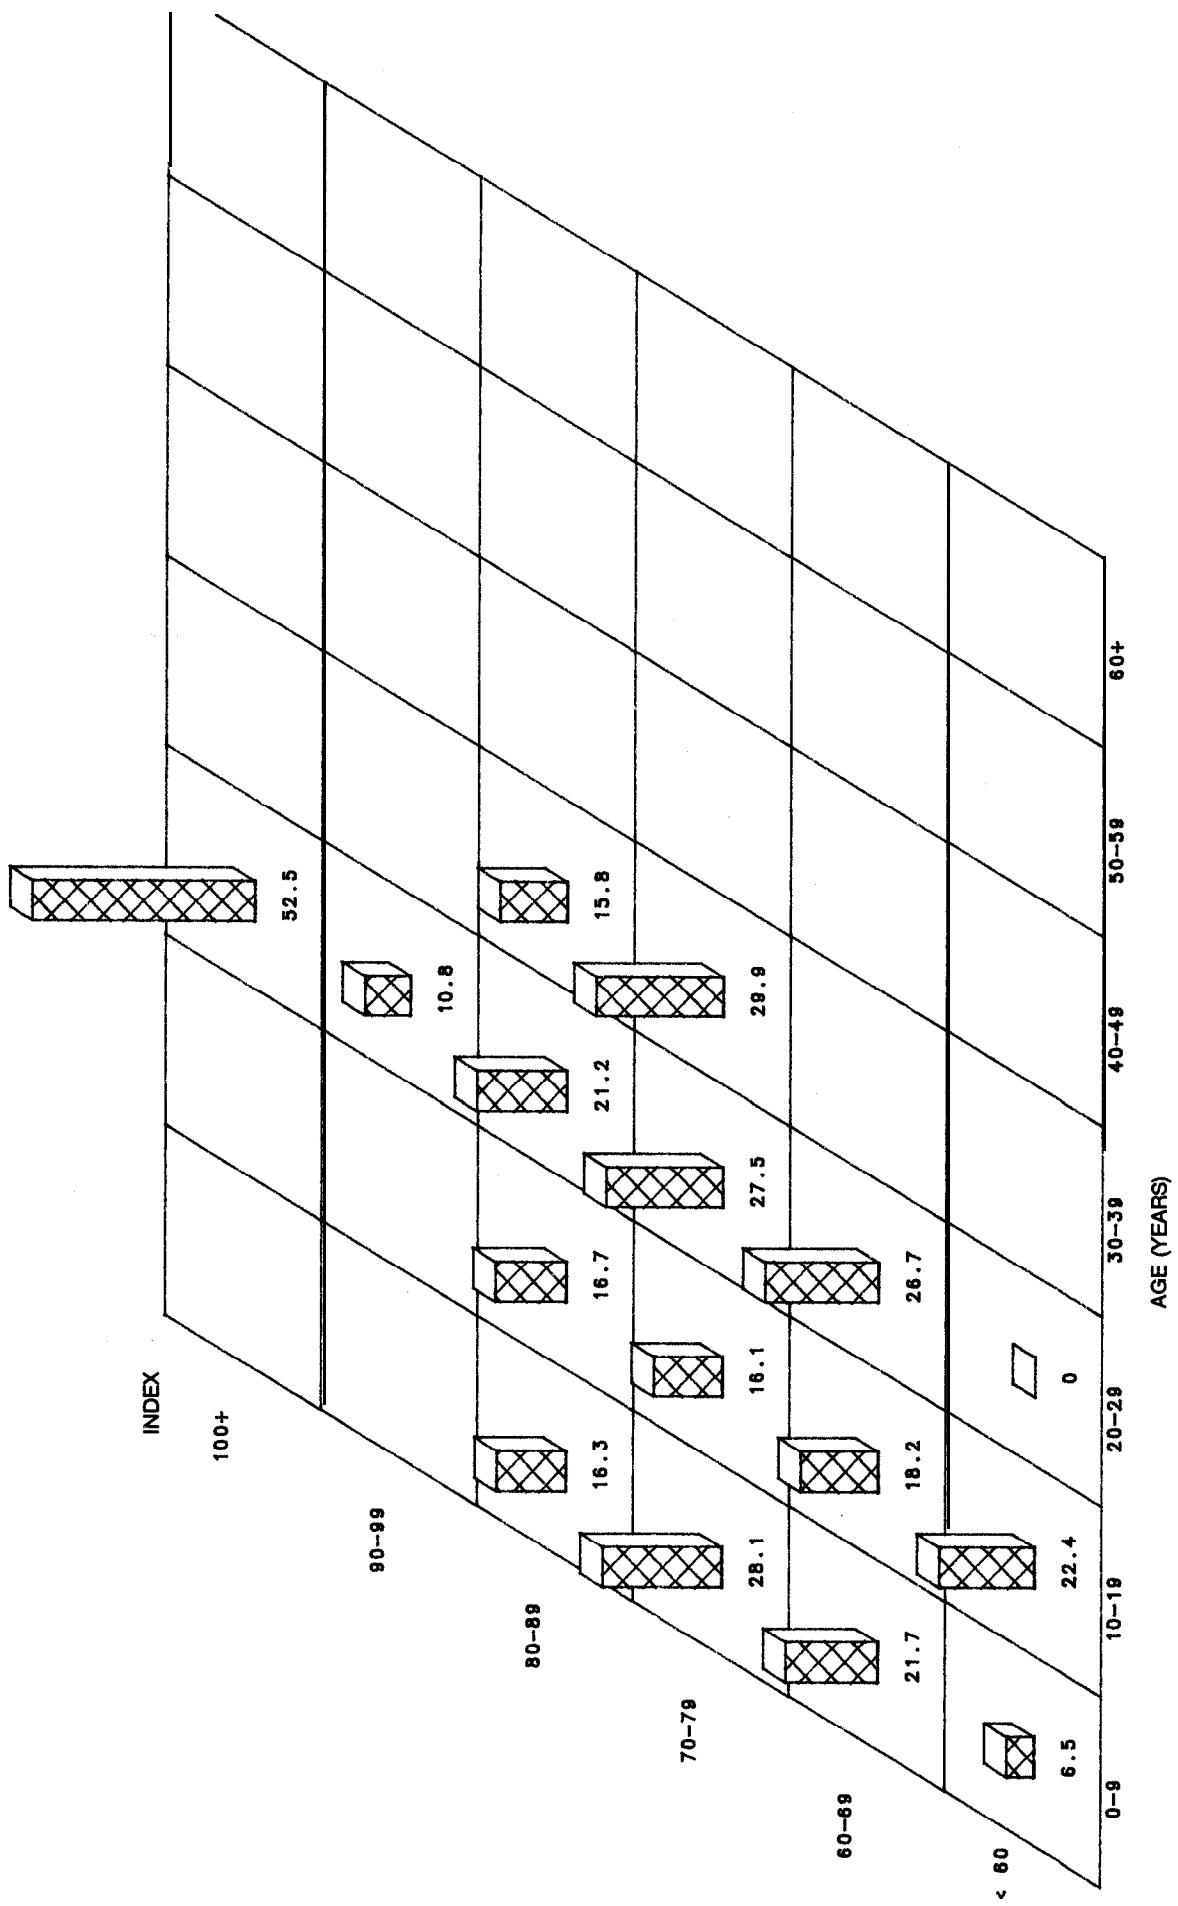

Figure 63C.—Percentage of basal area per acre in non-yellow-pine species, by site index and stand age, for planted loblolly pine stands in Virginia. (Represents 1,069,548 acres.)

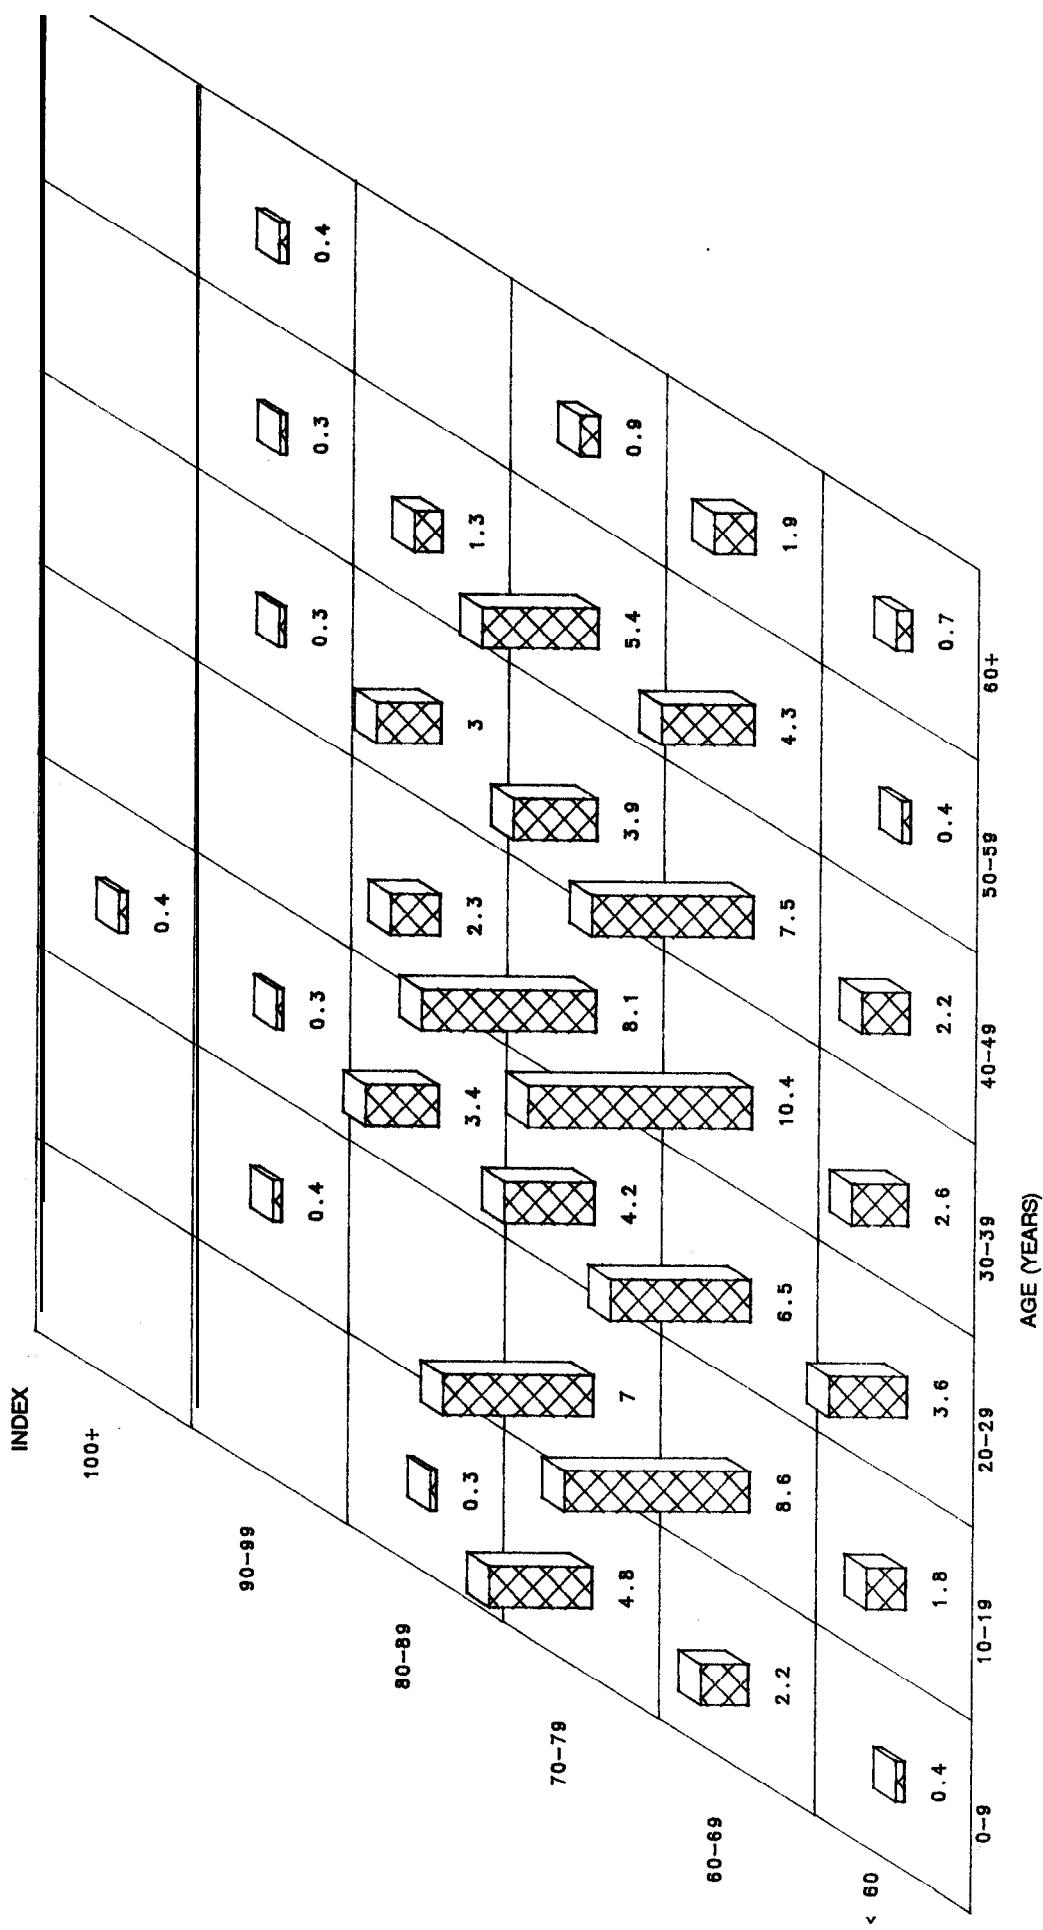

Figure 64A.—Percentage distribution of Virginia pine stands in Virginia, by site index and stand age. (Represents 994,116 acres of natural stands, and 35,628 acres of planted stands.)

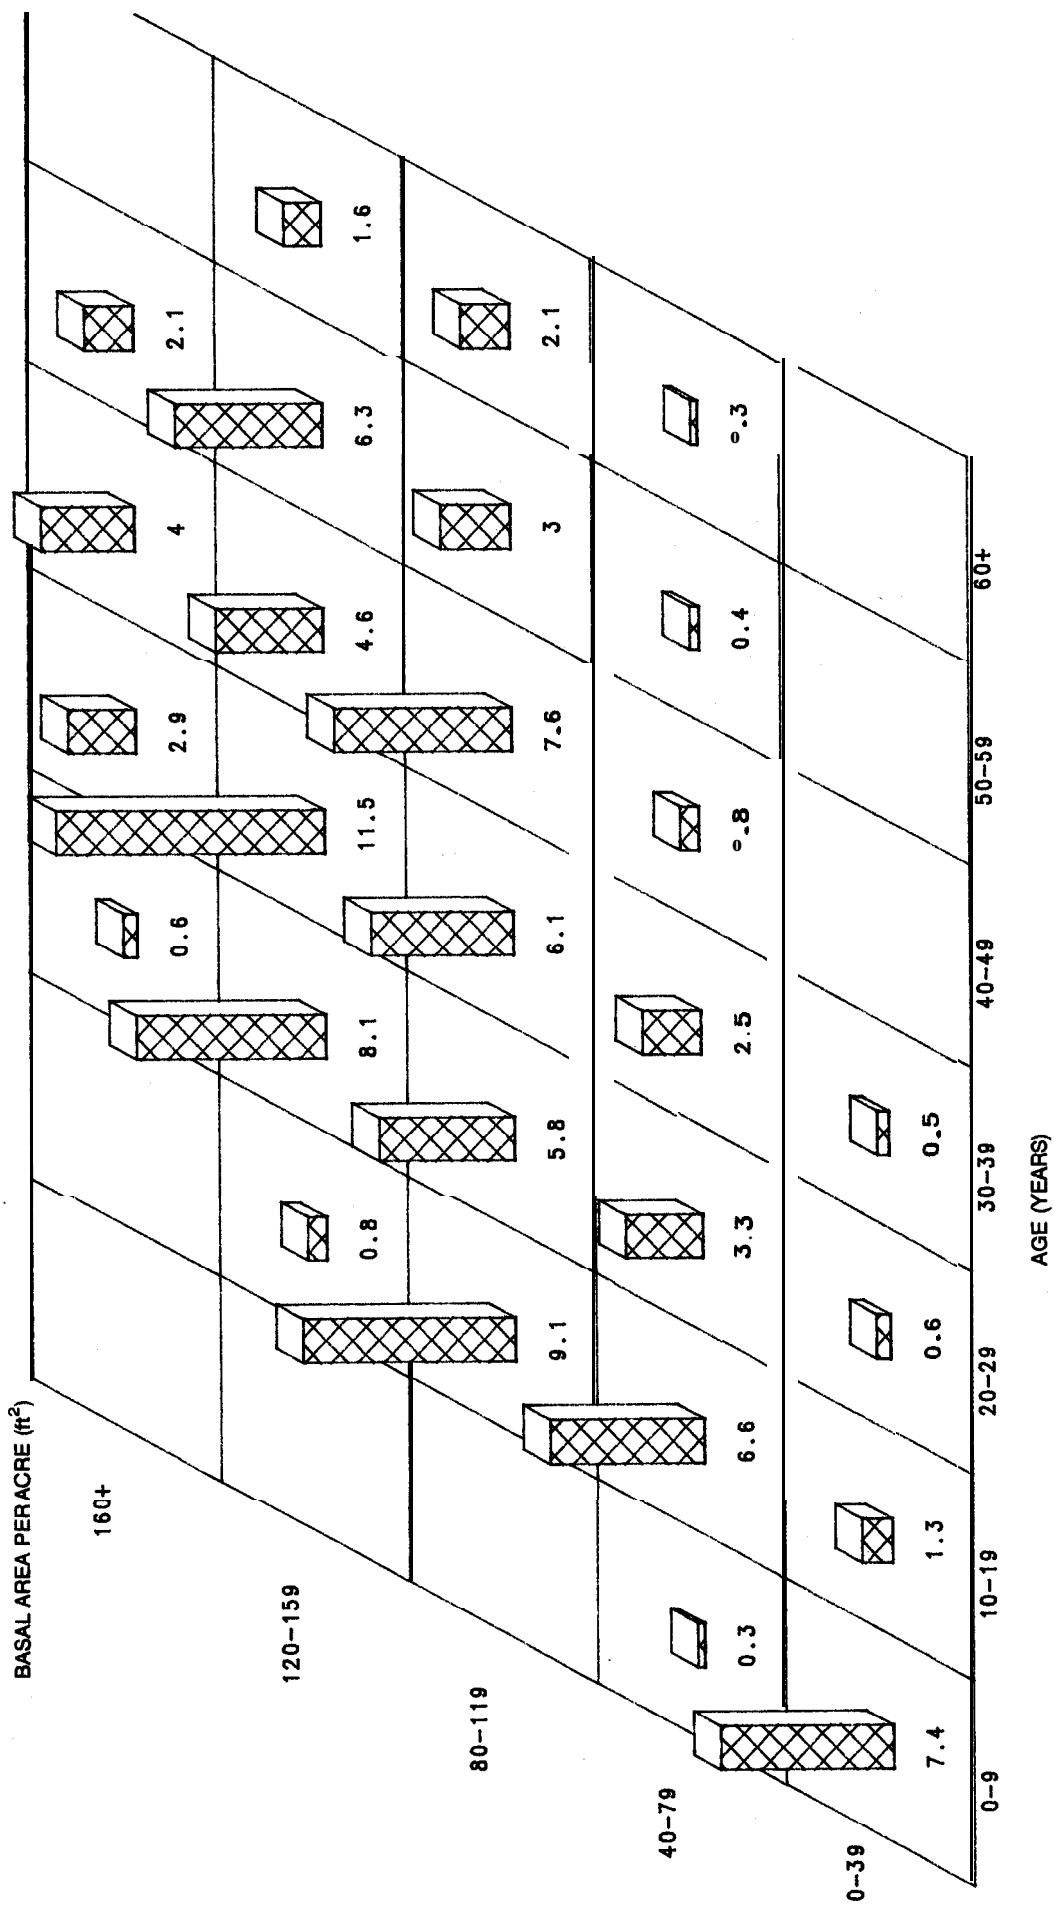

Figure 64B.—Percentage distribution of Virginia pine stands in Virginia, by basal area per acre and stand age.
 ents 994,116 acres
 of natural stands, and 35,628 acres of planted stands.)

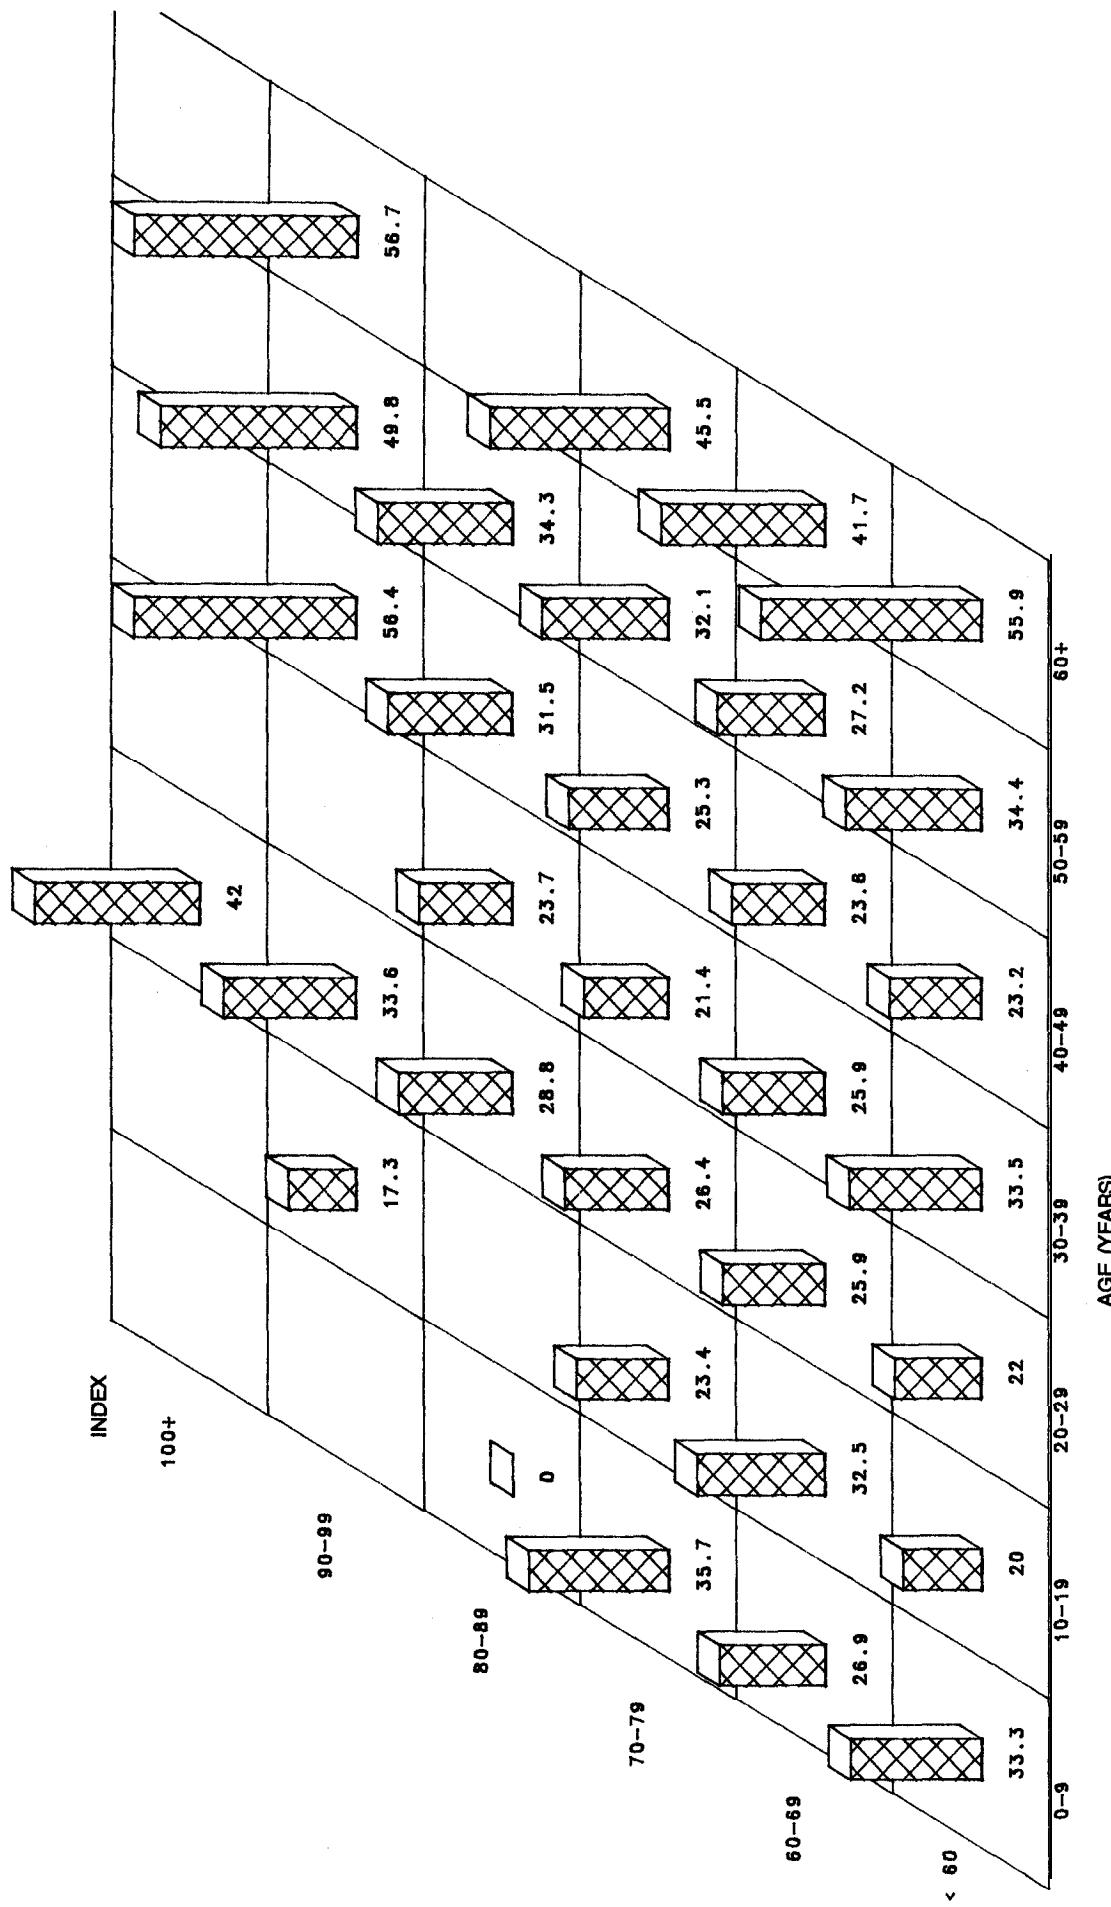

Figure 64C.—Percentage of basal area per acre in nonyellow-pine species, by site index and stand age, for Virginia pine stands in Virginia.
(Represents 994,116 acres of natural, and 35,628 acres of planted stands.)

Bechtold, William A.; **Ruark**, Gregory A.

Structure of pine stands in the Southeast. Resour. Pap. X-274.
Asheville, NC: U.S. Department of Agriculture, Forest Service,
Southeastern Forest Experiment Station; 1988. 185 pp.

Distributional and statistical information associated with stand age, site index, basal area per acre, number of stems per acre, and stand density index is reported for major pine cover types of the Southeastern United States. Means, standard deviations, and ranges of these variables are listed by State and physiographic region for loblolly, slash, longleaf, pond, shortleaf, and Virginia pine cover types. Graphic illustrations of multidimensional relationships among some of the variables are also provided.

KEYWORDS: Southern pine, timberland, Pinus, stand structure, forest inventory.
